Introducing Knoppix

“Knoppix is... so astoundingly useful it’s nearly impossible to overpraise” -- slashdot.org

What is Knoppix?

Linux that runs from CD

Knoppix is an astonishingly clever product. It is a single CD that runs Linux on your PC or laptop. It gives you a full graphical desktop with networking, sound, the lot (subject to suitable hardware). No installation is necessary.

Knoppix is excellent for demonstrations, system recovery, or just testing how well the hardware in a given PC is supported. The Knoppix CD is compressed. On-the-fly transparent decompression gives a remarkable 1,600 Mb of software on a single 700 Mb CD.

How it works

Start the computer using the Knoppix CD.

The computer runs from the CD drive. The existing software on the hard disk is by-passed. The hard disk can still be accessed read-only.

When you’ve finished using Knoppix, restart and take the CD out. The regular operating system will run in the usual way.
Safe to run

Knoppix leaves your existing software untouched. In fact, Knoppix can run on a computer with no hard disk at all! After running Knoppix, simply take the CD out of the drive. The computer will behave as if nothing has happened.

The general philosophy of Knoppix is to access disks in read-only mode as much as possible. This is ideal for beginners, because it protects against accidents.

Personal

Settings and personal files can be saved to a disk, such as a removable USB hard drive stick. This lets you store your personalised Knoppix setup and take it with you everywhere.

Free

Most amazing of all, Knoppix is free. The latest version is always available from the Knoppix home page.

Web link

The Knoppix project home page:
http://www.knoppix.net/

Not only is Knoppix free as in no charge, it is also free as in freedom. Subject to certain conditions, you are entitled to:

- Make unlimited copies.
- Use one copy on as many computers as you like.
- Give unlimited copies to your friends.
- Sell unlimited copies.
- Customise it to suit yourself.
- Redistribute your customised versions.

What you can do with Knoppix

Learn Linux

This book is designed to help you run Linux for the very first time. Knoppix is perfect for newcomers. Linux isn't going away any time soon. That is why learning it is an investment in your time that will pay off for years to come.

This book is meant for people who are at least reasonably familiar with computers. For example, I assume you know your way around your computer's mouse, keyboard, CD drive, and so on.
**Rescue and test**

Knoppix is a wonderful tool for rescuing and testing PCs. I will provide enough information to be useful, without going into mind-bending detail. With Knoppix it is possible to:

- Read files from Windows formatted hard disks, even when the operating system installed on the hard disk cannot be started.
- Copy files onto other disks, such as removable USB drives, Zip drives, CD-RW blanks and network drives.
- Identify hardware, even when Windows cannot identify it.
- Diagnose faulty hardware such as CD-ROM and hard drives.

**Use and explore**

Knoppix is a complete desktop system. Use it to:

- Print.
- Play sound.
- Use a scanner or a digital camera.
- Connect to the Internet.
- Browse the Internet's World Wide Web.
- Send and receive Internet email.
- Try out the built-in office applications, graphics tools, sound playing, video playing, Internet applications and games.

**Network**

Knoppix is a child of the Internet. Knoppix does networking with its eyes closed. For security reasons, Knoppix does not automatically run any servers that could be accessed from the outside.

**Where Knoppix comes from**

Knoppix was created in Germany by Klaus Knopper. Knoppix is a volunteer, co-operative, community effort. It exists entirely on the Internet. The Knoppix project is hosted by LinuxTag, which is based in Germany at the Technical University of Kaiserslautern. The LinuxTag team runs conferences, workshops and exhibitions for everyone interested in Linux and Free Software.
Knoppix is Free Software

Knoppix is "Free Software". It is licenced under the "GNU General Public Licence (GPL)". Free Software is not freeware, and not shareware. Free Software means "free as in freedom", not necessarily price. This means you are allowed to run, copy, distribute, study, change and improve Knoppix at no charge.

The "catch" is that when you give (or sell) copies to other people, you must give them the same freedoms under which you received it. This limitation ensures that Knoppix is free now and will remain free forever. For more details, see the "GNU General Public Licence" at the end of this book.

Limitations

No warranty

First and most important of all, Knoppix is experimental software. There is no warranty. Use it at your own risk.

CD means slow

Compact Disc Read Only Memory (CD-ROM) drives are much slower than hard disk drives. This means that some applications on the Knoppix CD may take a long time to start; much longer than they would do on a full permanent Linux system. However, Knoppix has some clever (optional) tricks that can spectacularly speed things up.

Knoppix does not get very far on unreliable CD-ROM drives. Since everything has to be loaded from CD, it falls over pretty quickly if CD-ROM errors occur, or if the Knoppix CD itself is damaged. Knoppix has built-in tools for testing its own media.

Not everything works

Knoppix supports a huge range of common PC hardware, but not everything. Internal dial-up modems and external USB broadband modems tend not to work. AOL and Compuserve are completely
incompatible. Certain cheap printers may be useless. Many cheap colour laser printers do not work. Support for wireless (802.11b) network adapters is limited at best. Certain types of multimedia audio and video files are unplayable. Most commercial DVD movie discs cannot be played. In general, Knoppix does not run Windows software.

**RAM intensive**

Knoppix works by loading everything into Random Access Memory (RAM). This is called a “RAM disk”. For this reason, the more RAM you have, the better. For typical performance, you need 128 Mb of RAM.

If you are lucky enough to have 828 Mb of RAM or more, Knoppix has clever tricks to make good use of all the RAM in your computer. This can deliver blazingly fast performance.

If you have less than 128 Mb of RAM, Knoppix has the ability to use part of the hard disk as if it were RAM. This is called creating a "swap file". However, this technique does not work on all hard disks, and performance is much slower than real RAM.

**What is included in Knoppix?**

Knoppix is a compilation of works from around the Internet. Some of the projects that have been put into Knoppix are:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Putting it all together is the work of the "Debian" project. The result is called the Debian "distribution". This means that Knoppix is Debian modified to run on a self-contained CD.

**What is Linux?**

Linux (pronounced "Lin-ucks") is a free "operating system". An "operating system" is the base software that makes a computer useful.

Strictly speaking, Linux is the "kernel". The kernel is the core component of the operating system. Think of an operating system as a nut. The "shell" is the part that you use. The kernel is the core that talks to the computer's hardware.

**Note**

There are many different Linux "distributions". But there is only one current version of the Linux kernel. Therefore, every distribution contains Linux.

**A little history**

In the 1970s, "computer programs" were free. A "program" is a sequence of instructions that makes a "calculating machine" do something useful. The engineers who worked on these instructions became known as computer "programmers". They shared their know-how and programs with each other. They found that it made their work more pleasant.

Unfortunately, this co-operative spirit died under commercial pressures. Restrictive practices in the fast-growing "computer software industry" meant that sharing programs, and vital technical information, became largely impossible.

A man named Richard Stallman was greatly frustrated by this change. He wanted to bring back the spirit of the early days that he had known at MIT (Massachusetts Institute of Technology). He knew that he had the perfect skills to build a free operating system. He knew that if he didn't do it, no-one would. So he decided to do it, or "die trying".
By the 1990s, Stallman’s "Free Software Foundation" had found or created nearly all the components of a free operating system. He called his creation "GNU Is Not UNIX".

The name "GNU Is Not UNIX" is a joke designed to poke fun at the alphabet soup of computer acronyms. Some acronyms have other acronyms as part of their definition. The GNU acronym takes this one stage further - it has its own acronym as part of its definition. "Is Not" is another way of saying "is like" or "is compatible with".

"UNIX" refers to a type of operating system that was common at the time. Stallman chose to base his efforts on UNIX because it was tried and tested. It would also be convenient for other people to switch from UNIX to GNU.

**How GNU grew**

In 1991, the GNU project still lacked a kernel, the vital core component of an operating system. Luckily, a student in Finland called Linus Torvalds created one "as a hobby".

---

*The Free Software Foundation’s Richard Stallman.*

*Linus Torvalds.*
In 1991, Torvalds produced a simple, basic system called "Freax". He called it "Linux" privately but never meant it to be called that in public, because he didn’t want to be too egotistical. He made it free because he wanted feedback. It was posted on the Internet by a friend.

Pretty soon, Torvalds began receiving email from places he’d dreamed of visiting, like Australia and the United States. Instead of cash, Linus preferred postcards. His sister Sara was suddenly impressed that her brother was somehow hearing from new friends far away.

Torvalds had used the Free Software Foundation’s tools, so he decided to make it free likewise. This was a way to say "thank you". He decided to put Linux under the Free Software Foundation’s "General Public Licence". This meant that anyone could use, improve or sell Linux, but no-one could take overall control.

**It's a GNU world!**

From there, it snowballed in the most extraordinary way. It has catapulted Torvalds to accidental super-stardom. He has appeared on the cover of "Time" magazine. We should remember that Stallman started it all. That is why the full title of Linux is “GNU/Linux”. In other words, Knoppix is a Linux-based GNU system.

---

Overview and history of the GNU project:
http://www.gnu.org/gnu/gnu-history.html
Knoppix for the first time

"The most important design issue... is that Linux is supposed to be fun." -- Linus Torvalds

Overview

The purpose of this section is to get you started into Knoppix for the very first time. This section skips nearly all of the options for starting Knoppix. The options for starting Knoppix are explained later.

Hardware requirements

The recommended hardware is as follows:

- Pentium I 350 Mhz processor (recommended minimum).
- 128 Mb RAM.
- Either: IDE or SCSI bootable CD-ROM drive
- Or: 3.5" floppy drive plus non-bootable CD-ROM drive.
- SVGA compatible graphics card (most cards supported).
- Monitor capable of 800x600 pixel resolution.
- Serial mouse, or PS/2 mouse, or USB mouse.

Starting Knoppix

There are two stages to starting Knoppix:

The first stage

The first stage is to get to the "boot prompt". The boot prompt lets you customise the Knoppix startup process. For example, you can specify at the boot prompt what screen resolution you want Knoppix to use. To reach the boot prompt, you use either the CD or the floppy disk.

The second stage

The second stage is to run Knoppix itself. This requires the CD. Knoppix follows the instructions given at the boot prompt to complete the startup process.
Getting to the boot prompt

From power-on to the boot prompt

To get to the boot prompt, follow these steps:

1. If the computer is already on, insert the Knoppix CD. If the CD drive is set to "auto-run", information explaining about Knoppix will appear. Restart the computer.

2. If the computer is off, turn it on, then immediately insert the Knoppix CD. To play for time, press the Pause/Break key immediately after turning your computer on. On many PCs and laptops, this will 'pause' the BIOS, giving you more time to insert the CD. Then press the Pause/Break key again to resume startup.

3. Most newer computers will automatically check for a bootable CD in the first CD-ROM drive. The Knoppix "boot prompt" should then appear. The boot prompt is the last three lines at the bottom of the screen. If your computer can't display the white and blue Knoppix logo, you will get a blue background instead. This is normal.

4. On some computers, you must press a key for the "boot device menu". The boot device menu is used to tell the computer which drive to boot from. A prompt saying which key will display the boot menu will appear on the screen just after you turn the computer on. For example, on some Dell desktop PCs, press F12 when prompted, press the Down Arrow key until "Boot from IDE-CDROM" is highlighted, then press Enter.
5. At the boot prompt, press Enter to boot Knoppix accepting all the
defaults (including the German keyboard/language.) If you do
nothing for 60 seconds, Knoppix boots automatically. To boot
Knoppix with another keyboard/language, see the section “Which
language?” below.

Tip
If you have two CD drives, and one of them is a CD Re-Writable drive,
put the Knoppix CD in the other drive. Keep your writable drive empty
if you can. This will let you try out the CD writing features in Knoppix
easily at a later time.

Quick help

Question: Why does Windows start instead of Knoppix, even
when the Knoppix CD is in the drive?

Answer: The CD-ROM drive is not set to boot before the hard disk, or the
CD-ROM drive is not bootable. Turn off the computer. Insert the
Knoppix boot floppy disk. Turn the computer back on. The computer
should boot from the floppy drive. The Knoppix boot prompt should
appear.

To fix the problem permanently, enter your computer’s Basic In/Out
System (BIOS) setup. The key to press that takes you into the BIOS
setup is usually shown on the screen just after you turn the computer on.
Visit the “boot priority” screen. Set BIOS to boot from the CD or floppy
drive first. If you are unsure, check with your motherboard or computer
manufacturer.

Question: The computer has two CD-ROM drives. Why does the
Knoppix CD boot in one drive but not the other?

Answer: Some BIOSes can only boot the first CD-ROM drive. To work
around the problem, start up from the Knoppix boot floppy disk. Then
you can put the Knoppix CD in either CD-ROM drive. If you are really
determined, switch the CD-ROM drive order so the drive you want to
boot from is the first drive.

Help at the boot prompt

Press F2 for the help screen. The help screen is a summary of the boot
prompt options. Pressing F2 or any other key cancels the timer, so
Knoppix will not automatically boot.
Which language?

The most important option at the boot prompt is the keyboard/language. More correctly, the keyboard/language option sets the locale. A locale is a collection of regional settings including keyboard layout, language, time format, date format, currency format and paper size.

The locale options are named using the International Standards Organisation two-letter country codes (ISO 3166 and ISO 639). The locale options are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language/keyboard</th>
</tr>
</thead>
<tbody>
<tr>
<td>cn</td>
<td>Canadian</td>
</tr>
<tr>
<td>de</td>
<td>German (default)</td>
</tr>
<tr>
<td>da</td>
<td>Danish</td>
</tr>
<tr>
<td>es</td>
<td>Spanish</td>
</tr>
<tr>
<td>fr</td>
<td>French</td>
</tr>
<tr>
<td>it</td>
<td>Italian</td>
</tr>
<tr>
<td>nl</td>
<td>Dutch</td>
</tr>
<tr>
<td>pl</td>
<td>Polish</td>
</tr>
<tr>
<td>ru</td>
<td>Russian</td>
</tr>
<tr>
<td>sk</td>
<td>Slovakian</td>
</tr>
<tr>
<td>tr</td>
<td>Turkish</td>
</tr>
<tr>
<td>tw</td>
<td>Taiwanese</td>
</tr>
<tr>
<td>uk</td>
<td>United Kingdom</td>
</tr>
<tr>
<td>us</td>
<td>United States</td>
</tr>
</tbody>
</table>

For example, to start Knoppix in the United Kingdom locale:
1. Type this at the boot prompt:
   knoppix lang=uk
2. Press the Enter key on the keyboard.
3. Knoppix will begin loading with the UK language/keyboard.

Quick help

Question: How do I get out of the boot prompt?
Answer: Take the CD out of the drive, then restart your computer.

The automatic startup process

This section is a description of what Knoppix does during the automatic startup process. The first thing that it does is boot the “Linux kernel”. The kernel is the “main program”. It controls the computer, starts new programs, and manages programs once they are running.

The kernel will try to start a “framebuffer console”. If successful, you will see a cute penguin logo in the top left corner. The number of penguins represents the number of Central Processing Units (CPUs) in your computer. This is either a pointless waste of space, or a cool hack, depending on your point of view.

If you do not have a graphics card that supports the “framebuffer console”, you will see the error message “You passed an undefined mode number”. This is harmless. Simply hit the Space bar on the keyboard to continue.

The Linux kernel will take a few seconds to detect the hardware in your computer. Then the "INIT" startup process will take over. Knoppix will try to detect and configure the following items, in this order:

1. Random access memory (RAM) size.
2. Processor model and speed.
3. Advanced Power Management (APM).
4. Universal Serial Bus (USB) interfaces.
5. Firewire (IEEE 1394) interfaces.
7. Sound card.
8. Video card.
11. Hard disk partitions.
12. Wired Ethernet network cards.
When this process is complete, it will briefly say "INIT: Entering runlevel 5". Next, Knoppix will try to start the "X Window System". The "X Window System" is the graphics display. Knoppix will automatically detect and use the highest available screen resolution and colour depth. If successful, you will see a black cross on a gray stippled background.

Knoppix will then begin loading the "K Desktop Environment". KDE runs on top of the X Window System. The progress of loading KDE will be shown in the middle of the screen. When KDE has finished loading, the Knoppix welcome page will be loaded.

When the welcome page appears, congratulations! You have started Knoppix and the K Desktop Environment successfully.
Getting out

Now that you've got Knoppix up and running, feel free to have a poke around. Everything is read-only, so you're unlikely to do any harm to your computer. To exit Knoppix:

1. Click the "K" menu in the bottom left corner.
2. Click "Logout".
3. Knoppix will begin its shutdown process.
4. The Knoppix CD will be ejected.
5. Remove the CD and close the tray.
6. Press Enter on the keyboard.

7. Knoppix will attempt to turn off the computer automatically. If it doesn’t turn off automatically, it is now safe to turn off the computer yourself using the power button.

**Tip**

For a quick exit, press Ctrl+Alt+Backspace. This “three finger salute” kills the X Window System. Killing the X Window System takes down KDE and all its open applications. Knoppix will then shut down automatically.

**Quick help**

**Question:** Why does KDE come up in German?

**Answer:** You need to specify the keyboard/language at the boot prompt. For example, for the UK locale, enter knoppix lang=uk at the boot prompt.

**Question:** It says 'cloop: read error', what does that mean?

**Answer:** This means there is a problem reading the Knoppix CD. You either have a faulty CD-ROM drive or a damaged Knoppix CD. To test the Knoppix CD, enter at the boot prompt:

```
knoppix testcd
```

This will make Knoppix check the media for errors. If you know that the Knoppix CD is good, this error usually means a faulty CD-ROM drive.

**Question:** I get a blank screen when the X Window System comes up, why?

**Answer:** This means Knoppix is trying to use a screen resolution that your monitor doesn’t support. For example, Knoppix may have detected your graphics card is capable of 1024x768 pixel resolution, but your monitor can’t cope with that. Try setting a lower resolution at the boot prompt. For example, enter:

```
knoppix lang=uk screen=800x600
```

This will make Knoppix use a screen resolution of 800 by 600 pixels when it starts the X Window System.

**Question:** Why does the screen go blank when the kernel boots?

**Answer:** This problem usually occurs with low cost TFT (flat screen) monitors. The kernel is using a framebuffer console, but the monitor is incompatible with it. Turn off the framebuffer console. At the boot prompt, use the option ‘vga=normal’. For example, type:

```
koppix lang=uk vga=normal
```

This will turn off the framebuffer console and the penguin logo.

**Question:** Why doesn’t the mouse work?

**Answer:** This could mean you are trying to use a PS/2 mouse in a 9-pin serial port through a PS/2-to-serial adapter. Some PS/2 mice do not work when plugged into a 9-pin serial port. Try a ‘real’ serial mouse.
**Question:** It says 'Initrd extends beyond end of memory'.

**Answer:** This means your motherboard is reporting the RAM size incorrectly. Specify the amount of physical RAM in your computer at the boot prompt. For example, if the computer has 128 Mb of RAM, enter at the boot prompt:

```
knoppix lang=uk mem=128M
```

**Question:** It says "Could not find the KNOPPIX filesystem, sorry. Dropping you to a (very limited) shell."  

**Answer:** Try booting with:

```
knoppix ide2=0x180 nopcmcia
```

If that doesn't work, it means your PCMCIA CD-ROM drive is not supported. There is a workaround. In Windows, copy the directory called "KNOPPIX" from the Knoppix CD to the root of a local FAT formatted hard drive partition (eg: drive "C:"). The copy will take some time to complete. Then start Knoppix and specify the partition that you copied the KNOPPIX directory to, using the 'fromhd=' boot parameter. For example, boot with:

```
koppix fromhd=/dev/hda1
```

If Windows is not available, use a single-floppy Linux such as "tomsrtbt" to do the copy, however that is beyond the scope of this book.

---

**Connecting to a local area network**

During the startup process, Knoppix will automatically detect the network card. For Local Area Network (LAN) access, Knoppix will automatically obtain an IP address from a Dynamic Host Configuration Protocol (DHCP) server. To check:

1. Click the Konsole button in the Panel (bottom row, 6th from the left).
2. Type this command and press Enter at the end of the line:

   ```
   ifconfig
   ```

3. You should see a response like this:
This says the first Ethernet interface (eth0) has been given the Internetworking Protocol (IP) address "192.168.1.18". If the Ethernet card has been given an IP address, it means the card is working.

To double-check the connection, find out the IP address of another computer on your network. For example, suppose another computer has the address 192.168.1.1. Type this command and press Enter, replacing 192.168.1.1 appropriately:

```
ping 192.168.1.1
```

You should see a response like this:
Press Ctrl + C on the keyboard to cancel pinging.

**Configuring the network card manually**

If there is no DHCP server on your network, you will need to configure the network card manually.

1. Click the Knoppix menu in the bottom left corner.
2. Point to Network/Internet.
3. Click Network Card Configuration.
4. You will be asked if you want to use DHCP broadcast.
5. Click "No".
6. You will be asked to enter the IP address that you want to give to the first Ethernet interface. You need to know an IP address that is free on your network. You can’t use an IP address that is already in use, or both computers will not be able to communicate.
7. Enter the IP address that you want to give to the card.
8. Click OK. Follow the prompts to complete the setup process.
Quick help

Question: There is no "eth0", why not?

Answer: Check the network cables. If there is a DHCP server on your local area network, make sure it is running. Click the "Knoppix" menu, choose "Root Shell" and enter:

/etc/init.d/network restart
pump -i eth0

Try configuring your network card manually. If it still won't work it may mean your network card is not supported.
**Knoppix essentials**

“If I ever meet Bill Gates, there wouldn’t be much of a meeting point. I couldn’t tell him about business, and he couldn’t tell me about technology.”
--- Linus Torvalds

So now you’ve got Knoppix started for the first time. Fantastic! What next? This section contains important background information that will help you understand the rest of this book.

**Virtual terminals**

There are five “virtual terminals”. Each virtual terminal gives you a way to interact with the system. When you start Knoppix, you are logged into each virtual terminal automatically. No passwords are needed. All passwords are locked by default.

<table>
<thead>
<tr>
<th>Keyboard shortcut</th>
<th>Virtual terminal</th>
<th>Logged in as user account</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+Alt+F1</td>
<td>Console number 1</td>
<td>root</td>
</tr>
<tr>
<td>Ctrl+Alt+F2</td>
<td>Console number 2</td>
<td>root</td>
</tr>
<tr>
<td>Ctrl+Alt+F3</td>
<td>Console number 3</td>
<td>root</td>
</tr>
<tr>
<td>Ctrl+Alt+F4</td>
<td>Console number 4</td>
<td>root</td>
</tr>
<tr>
<td>Ctrl+Alt+F5</td>
<td>X Window System (KDE)</td>
<td>knoppix</td>
</tr>
</tbody>
</table>

You can switch between the virtual terminals at any time. For example, to switch to the first console, press Ctrl+Alt+F1. The Knoppix startup messages will be displayed. To switch to the second console, press Ctrl+Alt+F2. To get back to the X Window System, press Ctrl+Alt+F5.

**Note**
The X Window System is on virtual terminal number 5.

**User accounts**

**The user account**

The Knoppix “user” account is called “knoppix”. This account is for all productivity tasks, including CD burning and printing. When the X Window System starts, you are logged in to the user account called “knoppix” automatically, no password required.
The superuser account

The "superuser" account is for system administration tasks only. The superuser account is called "root account". When Knoppix starts, you are logged in as "root" to all four consoles automatically no password. It is also possible to use the root account within the X Window System.

**Important**

Use the user account for all your everyday tasks. Only use the root account when you need it. This will help protect against accidents. Get into the habit now and it will save you later!

File names

The following rules apply to files in Knoppix.

- **All file names are case sensitive.** This causes the most problems for beginners. For example, "myfile.txt", "MyFile.txt" and "MYFILE.TXT" are all different names.

- **Long file names are allowed.** File names can be up to 255 characters.

- **There is no "C:" drive.** Instead, all files are arranged in a "tree" beginning with "/", which is called the "root directory". The “root directory” is the starting point for all the files and disks in the computer. For example, the "home directory" belonging to the "knoppix" user is located at "/home/knoppix".

- **All disks must be "mounted"** before they can be used. Removable disks must be "unmounted" before they can be removed. To "mount" a disk means to join the files on the disk onto the tree. This may sound strange, but it allows great flexibility.

- **Everything is a file.** Each "device" in the computer, such as the hard disk drive, is represented by a file. This is an powerful concept because it means hardware devices can be manipulated using ordinary file commands.
Note
What's the difference between a directory and a folder? Not much. A directory is a container that holds files and subdirectories. A folder is just the graphic that is usually used to represent a directory.

Disk names

You may be used to Microsoft Windows' naming scheme for drives. For example, you may be used to "drive A:" for the first floppy drive; "drive C:" for the first visible hard drive partition, and so on. Knoppix has its own drive naming scheme. This section explains how the naming scheme works.

Disk types

The naming scheme starts with a two-letter code for the type of disk.

<table>
<thead>
<tr>
<th>Name</th>
<th>Drive type</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>Conventional floppy drive</td>
</tr>
<tr>
<td>hd</td>
<td>Integrated Drive Electronics (IDE) drive</td>
</tr>
<tr>
<td>sd</td>
<td>Small Computer System Interface (SCSI) drive</td>
</tr>
</tbody>
</table>

IDE drives

IDE drives are the most common in desktop PCs and laptops. A single letter indicates how the drive is connected. Most PCs and laptops have two IDE "channels": primary and secondary. Each "channel" can have up to two devices: "master" and "slave".

<table>
<thead>
<tr>
<th>Name</th>
<th>IDE drive</th>
</tr>
</thead>
<tbody>
<tr>
<td>hda</td>
<td>Primary Master</td>
</tr>
<tr>
<td>hdb</td>
<td>Primary Slave</td>
</tr>
<tr>
<td>hdc</td>
<td>Secondary Master</td>
</tr>
<tr>
<td>hdd</td>
<td>Secondary Slave</td>
</tr>
</tbody>
</table>

SCSI drives

For SCSI drives, a single letter indicates its location. This is called its position in the "SCSI chain". SCSI hard drives are usually found in servers. Zip, USB and Firewire drives are also treated as SCSI drives.

<table>
<thead>
<tr>
<th>Name</th>
<th>SCSI drive location</th>
</tr>
</thead>
<tbody>
<tr>
<td>sda</td>
<td>First SCSI drive</td>
</tr>
<tr>
<td>sdb</td>
<td>Second SCSI drive</td>
</tr>
<tr>
<td>sdc</td>
<td>Third SCSI drive</td>
</tr>
</tbody>
</table>
Disk partitions
IDE and SCSI hard drives are divided into "partitions". Zip, USB and Firewire drives also contain partitions. A partition is like a compartment within a disk. There may be a single partition that covers the entire disk. There may be more than one partition. Each partition is indicated by a number.

<table>
<thead>
<tr>
<th>Name</th>
<th>Drive</th>
<th>Partition</th>
</tr>
</thead>
<tbody>
<tr>
<td>hda1</td>
<td>Primary master IDE drive</td>
<td>First partition</td>
</tr>
<tr>
<td>hda2</td>
<td>Primary master IDE drive</td>
<td>Second partition</td>
</tr>
<tr>
<td>hda3</td>
<td>Primary master IDE drive</td>
<td>Third partition</td>
</tr>
</tbody>
</table>

SCSI emulation for IDE CD-ROM drives
IDE CD-ROM drives are treated as SCSI drives. This is called "SCSI emulation". SCSI emulation is there so that CD burning applications can use the SCSI language on both SCSI and IDE CD writer drives.

<table>
<thead>
<tr>
<th>Name</th>
<th>CD-ROM drive</th>
</tr>
</thead>
<tbody>
<tr>
<td>scd0</td>
<td>First CD-ROM drive</td>
</tr>
<tr>
<td>scd1</td>
<td>Second CD-ROM drive</td>
</tr>
<tr>
<td>scd2</td>
<td>Third CD-ROM drive</td>
</tr>
</tbody>
</table>

Conventional 1.44 Mb floppy drives
For ordinary floppy disk drives, a number shows the drive number.

<table>
<thead>
<tr>
<th>Name</th>
<th>Floppy drive number</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd0</td>
<td>First floppy drive</td>
</tr>
<tr>
<td>fd1</td>
<td>Second floppy drive</td>
</tr>
</tbody>
</table>

Auto-detection of IDE and SCSI devices
Knoppix automatically detects all IDE and SCSI devices. The names of the devices are printed in the startup messages (Ctrl+Alt+F1). Here is an example:

hda: [FUJITSU MPA3026AT]
hdb: [LS-120 VER5 00 UHD FLOPPY]
hdc: [HITACHI DVD-ROM GD-2500]
hdd: [MATSUIIA CD-RW CD-7586]

This example shows the primary master is a Fujitsu hard drive. The primary slave is an Imation LS-120 SuperDisk drive. The secondary master is a Hitachi DVD-ROM drive. The secondary slave is a Matsushita CD-RW drive.
Auto-detection of partitions

Knoppix automatically detects all partitions on all IDE and SCSI devices. For example, given a single Windows partition on the primary master IDE hard drive, the following "device name" will be created:
/dev/hda1

This means the partition will be called "/dev/hda1" in Knoppix.

Note
Some removable disks also have partitions, notably Iomega Zip disks. For the partitions on an Iomega Zip disk to be detected properly, you must insert the disk into the drive before you start Knoppix.

Auto-creation of mount points

Each device name has a "mount point". This is a special place where the files on a device appear. A mount point is created automatically for each device name. For example, given the Fujitsu drive above, the following "mount point" will be created:
/mnt/hda1

This means the partition "/dev/hda1" will be "mounted" to "/mnt/hda1".

Auto-mounting of floppy and CD-ROM drives

Conventional floppy and CD-ROM drives are "auto-mounted". This means Knoppix takes care of mounting and unmounting them automatically. The auto-mount locations are:

- First floppy drive: /mnt/floppy
- Second floppy drive: /mnt/floppy1
- First CD-ROM drive: /mnt/cdrom
- Second CD-ROM drive: /mnt/cdrom1
The K Desktop Environment

The "K Desktop Environment" (KDE) is a modern, powerful and free graphical user interface environment for UNIX compatible systems. Its name is a play on the “Common Desktop Environment” created by Sun Microsystems in the 1980s. This section explains what KDE has to offer.

Web link
The home page of the K Desktop Environment:
http://www.kde.org/

Looks familiar?

KDE looks familiar to Windows and Macintosh users because it takes some of the best elements from each. There is an important difference: everything is single click. Nothing needs a double-click to make it work. If you double-click, you'll end up with a program running twice, or something else you don't need. Just single click.

Tip
To select a file instead of opening it, hold down the Ctrl key and click the left mouse button. The icon will be selected, rather than opened. It is then safe to let go of the Ctrl key.

Most icons have a context menu. To get the context menu for an icon, right-click on the icon.

You'll get a little pop-up menu of common actions for that icon. This also works on window edges, toolbars, and just about everything else.
Like Macintosh and Windows, most icons have a tooltip. Hover the mouse pointer over an icon. A little yellow label will tell you what that icon does.

Tooltips only work in the current active window. This means that if you have two windows open, you will only get tooltips in the window that is at the front. To get tooltips in the other window, you must click it to bring it to the front.

The Desktop

The main part of the screen is called the "Desktop". This is where the application windows appear. There are also icons for each "disk device" in the system.

Here are device icons for two CD-ROM drives, a 1.44 Mb floppy drive, and a hard disk partition.
These icons are actually hyperlinks. In other words, they are just pointers to the place in the system where the files appear. You can’t drag and drop files and folders onto Desktop device icons, as you can on the Apple Macintosh.

**Note**

Desktop icons are shortcuts. There are no files inside Desktop icons. Instead, Desktop icons are just pointers to the places where the files actually appear.

If you plug in a hot-pluggable disk device, such as a USB external hard drive, a new icon for it will appear on the Desktop. This behaviour will be familiar to Apple Macintosh users.

**The Panel**

At the bottom of the screen is the "Panel". The Panel is always visible. It contains various utilities and status information.

**K Menu**

In the far left corner of the Panel is the "K Menu" which is just like the Windows "Start" menu. Click for a list of programs that are available on the system.

**Quick launch**

Next to the K Menu are "Quick Launch" icons. These icons represent frequently used programs.
Hover the mouse pointer over the program icon for a description of what it does. Single-click on the icon to start that program. Be aware that the "OpenOffice" program may take several minutes to start, especially if you have a slower computer or CD-ROM drive.

**Desktop Guide**

The "Desktop Guide" consists of four squares. Each square represents one desktop. You start off in the first desktop. Click in the Desktop Guide to switch between the four available desktops.

![Desktop Guide](image)

To move open windows between Desktops, click the Window Control Box at the top left corner of the window. Point at "To desktop", then choose the Desktop that you would like to send the window to.

**Taskbar**

A button is shown in the "Taskbar" for each open window. This example shows three open windows; the "Konsole", the "Konqueror" web browser, and "The GIMP" graphics editor.

![Taskbar](image)

**System Tray**

The "System Tray" contains an icon for the current keyboard layout. To view the available keyboard layouts, right-click on the keyboard layout icon.

![System Tray](image)

**Clock**

The clock shows the time and date.

**Hide Panel**

At each end of the Panel is a "Hide Panel" button. Click the Hide Panel button to make the Panel shrink to that side of the screen. Click the button again to unhide the Panel. Drag the Hide Panel button to move the entire Panel from one side of the screen to another.
Left mouse button selects text, middle button pastes

To copy and paste text using a three button mouse:

1. Select the text that you want to copy and paste with the left mouse button, so that the text is highlighted.
2. Let go of the left mouse button.
3. Point to the place where you want the text to go.
4. Click the middle mouse button.
5. The last selected text will be pasted from the "X Window System copy buffer" into the place where you clicked.

This trick is part of the X Window System, the graphics display that lies underneath KDE.
Identifying hardware

Knoppix has built-in hardware identification. This means Knoppix can identify the make and model of a huge range of common PC components, such as processors, graphics cards, network cards, and so on. To use the hardware identification:

1. Click K Menu.
2. Click System.
3. Click Info Center.

4. The “Info Center” application will come up. On the left side are the various categories. Click a category to view the details.
The most useful categories are:

- Processor (Central Processing Unit)
- Memory (Random Access Memory, RAM)
- Partitions (partitions on hard disks and other drives)
- PCI (Peripheral Component Interconnect cards)
- PCMCIA (Personal Computer Manufacturer Interface Adaptor credit-card sized cards for laptops)
- Storage Devices (hard disks and other drives)
- USB Devices (Universal Serial Bus peripherals).

The identification of PCI cards, ISA cards and PCMCIA adapters is remarkably accurate. The identification strings are often provided by Linux users, rather than the card vendors themselves. If you plug in a new USB device, and you are already on the USB Devices page, choose any other category and then select USB Devices again to refresh the list.

Limitations

The ability to identify hardware is tremendously useful. However, there are certain limitations you should know about.
Can't identify PCI/PCMCIA hardware newer than itself

The most important limitation is that Knoppix cannot accurately identify PCI and PCMCIA hardware newer than itself. USB and Firewire devices work differently and are not subject to this limitation.

This book comes with Knoppix version 3.3, which is dated September 2003. Knoppix should be able to identify most hardware made before then (except the very old or very rare).

However, Knoppix version 3.3 may only be able to identify PCI and PCMCIA hardware made after September 2003 as an “Unknown device”. A newer version of Knoppix may help. A newer version can be obtained from the Knoppix web site and from other vendors.

Can't identify winmodems

A "winmodem" is a modem that relies on Windows software to make it work. This is done to save a few components and reduce manufacturing costs. For this reason, “winmodems” tend not to work well with Knoppix. A common example is the Intel 537 series of PCI internal modem cards.

Knoppix can only tell you what a winmodem identifies itself as, in its hardware. Knoppix cannot tell you about the Windows-specific software needed to get it working in Windows. For example, in the case of Intel 537 based winmodems, there are many different vendor-specific Windows drivers, which may be incompatible with each other. However, these cards will all be reported the same in Knoppix. That is more a limitation of the hardware, rather than a limitation of Knoppix.

Identified does not mean supported

Knoppix may not have driver support for all the hardware it can identify. In other words, just because Knoppix tells you the make and model of a device does not mean it actually works in Knoppix. For example, the Intel 536EP internal modem PCI card is accurately identified; but it is not usable because it requires proprietary software that cannot be distributed with Knoppix.

Not guaranteed

The identification provided by Knoppix is not guaranteed. This is because Knoppix is not perfect (sorry). The hardware identification strings are mostly provided by Linux users, rather than the hardware vendors themselves.
What drives do I have?

A list of the Integrated Drive Electronics (IDE) drives in your computer is usually shown on your computer’s Basic In/Out System (BIOS) screen. The BIOS screen is shown at the very beginning immediately after you turn your computer on. To get a listing of IDE devices within Knoppix:

1. Click the Konsole (bottom row, 5th from the left).
2. Enter the following command, then press Enter.
   ```bash
dmesg
   ```
3. The `dmesg` command shows the “kernel messages”. The kernel messages tell you what the “Linux kernel” has found in your computer. You will get quite a lot of output. Scroll up about two-thirds of the way until you see lines like this:
   ```plaintext
   hda: ST320410A, ATA DISK drive
hdc: JLMS XJ-HD165H, ATAPI CD/DVD-ROM drive
hdd: LITE-ON LTR-52327S, ATAPI CD/RW drive
   ```

   This shows that the primary master IDE drive (hda) is a Seagate Technology 320410A AT Attachment disk drive. The secondary master (hdc) is a JLMS AT Attachment Packet Interface CD/DVD-ROM drive. The secondary slave (hdd) is a Lite-On CD/RW drive.
Reading the hard disk

Knoppix has the ability to read files from the computer’s internal hard disk. Knoppix has built-in support for Integrated Drive Electronics (IDE) and Small Computer System Interface (SCSI) hard disks. Knoppix supports many partition formats, including:

- Microsoft Disk Operating System (MS-DOS).
- Microsoft File Allocation Table (FAT).
- Microsoft New Technology Filing System (NTFS).

FAT is found in Microsoft Windows 95, 98 and Millennium. NTFS is used in Microsoft Windows NT, 2000 and XP. Windows 2000 and XP also support FAT. To browse the files on the internal hard disk, look on the Desktop. You will see an icon for each partition that Knoppix has identified. To access the files on that partition:

1. Click the icon for the hard disk partition.
2. Wait for a moment while the partition is "mounted". A green triangle will appear, indicating that the partition is in use.
3. Wait while the "Konqueror" file manager starts up.
4. The files on the partition will be displayed, read only. For example, a typical Windows 98 partition looks like this:

![Hard Disk Partition](image)
Selecting files and folders

To create data CDs and copy files and folders onto other disks, you need to know how to select. There are several ways to select files and folders.

- Lasoo. Click and hold the left mouse button on a blank area in the "Konqueror" window. Drag across to the opposite corner. The files and folders in the marked area will be selected. To unselect, click any blank area within the window.

- Ctrl + click. Hold down the Ctrl key on the keyboard, and click a file or folder. It will be selected. To unselect, Ctrl + click the file or folder icon again, or click any blank area within the window.

- Shift + click. Ctrl + click the first file or folder. Let go of the Ctrl Key. Hold down the Shift key, and select the last file or folder. The range will be selected. To unselect, click any blank area within the window.

- Right-click. Click the right hand mouse button on a file or folder. A "context menu" will appear, showing the most common actions for that item. The file or folder will also be selected. To unselect, click any blank area within the window.
Enabling write access

Knoppix has the optional ability to write to hard disk drives. "Write mode" lets you copy files to the drive, and change existing files. Knoppix supports writing to MS-DOS and FAT formatted partitions. Writing to NTFS is not supported. To enable write access:

1. Click the icon of the hard disk partition you want to write to.
2. Wait for a moment while the partition is mounted.
3. Wait while the "Konqueror" file manager starts up.
4. The files on the partition will be displayed.
5. Right-click the icon of the hard disk partition.
6. Click "Change read/write mode".
7. You will be prompted to change the partition to be writable.
8. Click "Yes".
9. You will now be able to write files to the partition.
CD writing

Knoppix has built-in support for CD writing. To create your own CDs using Knoppix, it is best to have two CD drives. You need one drive for the Knoppix CD, and a Compact Disc Re-Writable drive for the blank media. Normally, the Knoppix CD occupies the first drive, and it cannot be removed while Knoppix is running.

However, if you have a suitable hard disk, it is possible to start Knoppix from a single CD-ROM drive and then use it for other CDs. See the later section, "Advanced startup options".

The following CD-RW drives are compatible with Knoppix:

- All SCSI CD-RW drives.
- Most external (USB) CD-RW drives.

Knoppix uses SCSI commands to create CDs. When working with IDE CD-RW drives, Knoppix uses "SCSI emulation". This means that Knoppix can work with an IDE CD-RW drive, while actually using the SCSI language to write to the drive. For this reason, SCSI CD-RW drives are ideal, while most IDE CD-RW drives should work.

To copy files onto a data CD using Knoppix:

1. Select the files or folders to be written onto CD.
2. Right-click on the selection.
3. Click "Create CD with K3b".
4. Wait for a moment while the "K3b" program starts.
5. The "K3b" window will be displayed. In the "Current Projects" pane you will see the folder that you chose.

6. The disk usage is shown in the green bar at the bottom of the Projects pane. It shows the amount of space that will be used on the writable CD. This example shows 90.3 Mb will be used, out of a possible 650 Mb. To add additional files and folders, drag and drop them into the Project pane.

7. Click the "Burn" button (fourth from the left in the toolbar).

8. The disk writing window will be appear. The make and model of your CD-RW drive will be shown.

9. Select the writing speed to be used from the "Speed" box. The correct writing speed to choose depends upon the speed of your CD-RW drive and the media. For example, if you have an "8x" CD-RW drive and "4-10x compatible" media, choose 8x.
10. Click "Write".

11. The CD will be created. When the writing process has finished, the CD will be ejected.
12. Click "Close" to return to K3b.

Quick help

Question: Why does it eject the CD and do nothing? Or, why do I get an error while CD writing?

Answer: You may be trying to use incompatible media. For example, if you try to write onto CD-RW media labelled "4-10x compatible" at 32x then the drive will just eject the blank CD.
Reading CD-ROMs

Knoppix has built-in support for reading “Compact Disc Digital Data” discs. To read a data CD:

1. Insert the data CD into an empty CD-ROM drive.
2. Click the icon on the Desktop on that represents the drive. The "CDROM" icon represents the first CD drive, and "CDROM1" represents the second drive. In Windows, the first drive is given a lower drive letter (eg "D:"), the second drive is given a higher drive letter (eg "E:").
3. A green triangle will appear on the CD drive icon to indicate that the drive is in use.
4. Wait while the "Konqueror" file manager starts up.
5. The files on the CD will be displayed.

Ejecting the CD

1. Close all windows and files opened from the CD.
2. Press the Eject button on the front of the drive.
3. The CD tray will be ejected.

Quick help

**Question:** When trying to access a CD for the first time, it says "The file or directory file:/mnt/cdrom does not exist". What does this mean?

**Answer:** Usually this means the drive is still preparing itself, or the Knoppix "auto-mounter" has not finished working yet. Wait a few moments, then try again. If it still doesn't work, click the Home icon in the Panel, then in the Location bar type 'file:/mnt/auto/cdrom' or 'file:/mnt/auto/cdrom1'. If it still doesn't work, click the Knoppix icon in the Panel, click Root Shell, then enter this command: /etc/init.d/autofs restart.

**Question:** Why is the CD stuck in the drive?

**Answer:** Knoppix uses the locking mechanism of the drive to prevent you from taking out a CD that is still in use. Close all windows and documents opened from the CD, then try again.

**Question:** Why is it that when taking the CD out, the files in the CD window suddenly disappear?

**Answer:** Once the CD has been taken out, its files are no longer available to the system and therefore cannot be displayed. This is normal.
Question: When I right-click on the CD drive's icon and then click "Eject", it says "Eject failed!" What does that mean?

Answer: It means the CD drive doesn't like the Knoppix "eject" program. Just press the eject button on the front of the drive instead.
Using an external USB drive

Knoppix supports two types of external USB hard drive:

- USB hard drive stick (flash drive).
- Conventional external USB hard disk drive.

Knoppix uses its built-in "USB Mass Storage" driver to support these drives. Both USB 1.1 and the faster USB 2.0 drives are supported. USB 1.1 drives work at 12 Mbits per second (about 1.5 megabytes per second). USB 2.0 drives work at up to 480 Mbits per second (about 60 megabytes per second).

A USB hard drive stick is a small device like a key fob. They are sometimes called USB pen drives. Many digital cameras also work as an external USB hard drive. Any digital camera will work provided it supports USB Mass Storage. Some digital cameras have to be put in "DSC Mode" to enable USB Mass Storage. To copy files onto an external USB hard disk drive:

1. Insert the USB hard drive into any USB socket.
2. After a short pause, an icon for each partition on the new drive will appear. In most cases there will be a single partition on the USB drive that covers the entire disk, so one new icon will appear.
3. Click the USB drive's icon.
4. Wait for a moment while it is "mounted".
5. The files on the new partition will be displayed.
6. Right-click on the icon of the USB drive.
7. Click "Change read-write mode".
8. Click "Yes".
9. Drag and drop the files or folders that you want to copy into the window of the USB drive.
10. Click "Copy Here".

11. The files or folders will be copied.

12. When copying has finished, close all open windows for the USB drive.

13. Right-click on the icon of the USB drive.

14. Click "Unmount".

15. The green triangle on the USB drive’s icon will go away.

16. It is now safe to take the USB drive out of its socket.

**Question:** Why did it say "out of disk space" when copying to the flash drive, even though the size of the files to be copied is less than the free space on the drive?

**Answer:** Some flash drives are formatted with the FAT12 or FAT16 filesystem. This is inefficient. If there are a lot of small files, the flash drive may fill up much more quickly than you might expect. There are two ways round the problem:

- The first way is to archive the files onto the flash drive. To archive means to create one big file instead of lots of small ones. To create an archive, click K menu, Utilities, Ark (Archiving Tool). The second way is to reformat the drive to a more efficient filesystem, such as FAT32.
Using a 3.5" floppy drive

Knoppix supports all standard 1.44 Mb floppy drives. If you have an Imation LS120 SuperDisk drive, see the later section. The SuperDisk drive is not a standard 1.44 Mb floppy drive; it works quite differently. To copy files onto a 3.5" floppy drive:

1. Check the write-protect tab on the floppy disk. Make sure the tab is in the closed (write enabled) position.
2. Insert the floppy disk into the drive.
3. Click once on the "Floppy Disk" icon on the Desktop.
4. The files on the floppy will be displayed.
5. Drag and drop files and folders to be copied into the floppy disk window.
6. Click "Copy Here".
7. The files will be copied.
8. Wait until the floppy drive's "busy" light goes out.
9. Close the floppy disk window.
10. It is now safe to remove the floppy disk from the drive.

*Note*: Unmounting 3.5" floppy disks is done for you automatically. There is no need to do "Change read-write mode" in order to write files to floppy disk.

Quick help

**Question: How do I format a 3.5" floppy?**

Answer: Right-click the "Floppy disk" icon on the Desktop, then click "Format Floppy disk".

**Question: I have an Imation SuperDisk floppy drive. Why does clicking on the Floppy icon not do anything?**

Answer: The Imation SuperDisk is not an ordinary floppy drive. It is treated as a hard disk drive. Follow the instructions in the Imation LS-120 SuperDisk section.
Using an Iomega Zip disk

The Iomega Zip disk drive was very popular in the 1990s. It has been somewhat superseded by the CD-RW and the USB flash drive. However, Iomega Zip drives, and their media, are still easy to find and often useful. The usual capacity of Iomega Zip media is 100 or 250 Mb.

There are three varieties of Iomega Zip drive: internal, parallel, and USB. The internal and parallel varieties are older and are no longer made. The USB variety is newer and is still being made today.

Note

Iomega measures its disk capacities in megabytes where 1 megabyte = one million bytes. This is less than the conventional definition where 1 megabyte = 1,048,576 bytes. Knoppix uses the conventional definition. Therefore a "Zip 100" disk has an actual capacity of 98,078 kilobytes according to Knoppix.

Using an external USB Iomega Zip drive

The external USB Iomega Zip drive is available in 100 Mb, 250 Mb and 750 Mb versions. The 750 Mb version also supports USB 2.0 for higher transfer speeds. Knoppix uses its built-in USB Mass Storage driver to support the external USB Iomega Zip drive. To copy files onto an external USB Iomega Zip drive:

1. With the computer turned off, plug the Zip drive into any USB socket.
2. Insert a valid PC formatted Zip disk into the drive.
3. Start Knoppix, but specify text mode at the command prompt. For example, enter:
   
   knoppix lang=uk dma 2

4. Knoppix will start up, but then stop before loading KDE.
5. Press Enter on the keyboard to wake up the command prompt. Type this command, then press Enter:
   
   rebuildfstab -u knoppix -g knoppix

6. You will see the activity light on the front of the drive will come on, and you will hear the drive work. The rebuildfstab command checks the partitions on the Zip disk. It then sets up the "filesystems control file" so that the Zip disk can be accessed by the user “knoppix”.

7. Switch to graphics mode with this command:
   
   init 5
8. After KDE loads, you will see an icon for the Zip drive on the Desktop. Assuming you have no other SCSI drives, the icon will be labelled "Hard disk partition [sda4]".

9. Click the icon for the Zip drive.

10. Wait while the device is mounted.

11. Wait while the "Konqueror" file manager starts up.

12. The files on the Zip disk will be displayed.

13. Right-click the Zip drive's icon.

14. Click "Change read/write mode".

15. Click "Yes".

16. Drag and drop the files and folders to be copied into the Zip disk's window.

17. Click "Copy Here".

18. The files and folders will be copied.

19. Close all the Zip disk's open windows.

20. Right-click on the Zip drive's icon.

21. Click "Unmount".

22. The green triangle will go away.

23. It is now possible to take the Zip disk out of the drive.

---

Note

Hot-plugging the external USB Iomega Zip drive is not supported. This means you need to have the drive connected before you start Knoppix. You can't plug the Zip drive into the computer when it is already running and expect an icon for it to appear, as you can with USB flash drives and other USB external hard drives.

Using an internal IDE Iomega Zip drive

The internal IDE Iomega Zip disk drive is like an internal hard drive, but with removable writable media. Knoppix uses its built-in ATAPI (AT Attachment Packet Interface) driver to support the internal Iomega Zip drive. Typically the maximum disk capacity is 100 Mb. To copy files onto an internal Iomega Zip drive:

1. With the computer turned off, insert a PC formatted Zip disk into the Zip drive.

2. Start Knoppix in the usual way.

3. You will see an icon for the Zip drive on the Desktop. Assuming there are no other SCSI drives in your computer, the icon will be labelled 'Hard disk partition [sda4]'.

4. Click the icon for the Iomega Zip drive.
5. Wait for a moment while the Zip disk is mounted. A green triangle will appear indicating that the drive is in use.

6. Wait while the "Konqueror" file manager starts up.

7. The files on the disk will be displayed.

8. Right-click on the icon of the Zip drive.

9. Click "Change read/write mode".

10. Click "Yes".

11. Drag and drop the files you want to copy into the Zip drive window.

12. Click "Copy Here".

13. The files will be copied.

14. Close the Zip drive’s windows.

15. Right click on the Zip drive icon.

16. Click "Unmount".

17. The green triangle will go away.

18. It is now safe to take the Zip disk out of the drive.

Using a parallel port Iomega Zip drive

The external parallel port Iomega Zip disk drive is the oldest kind of Zip drive. It was marketed for its high capacity, speed and portability. It is fully supported in Knoppix. Everything needed to use it is included in Knoppix, however, a “helping hand” is needed. To copy files onto an external parallel Zip drive:

1. With the computer turned off, connect the Zip drive to the computer's parallel (printer) port. Connect the Zip drive to the mains and turn the Zip drive on.

2. Insert a valid PC formatted Zip disk into the drive.

3. Start Knoppix, but at the boot prompt, specify text mode. For example, enter:

```
knoppix lang=uk 2
```

4. Knoppix will start up and then stop before loading KDE.

5. Press Enter on the keyboard to wake up the command prompt.

6. The next step is to enable the Iomega parallel Zip drive support. Look at the underside of the drive. The date of manufacture should be printed there. If your drive was made before 31 August 1998, enter this command and press Enter.

```
modprobe ppa
```

If your drive was made after 31 August 1998, type this and press Enter:

```
modprobe imm
```
7. If successful you will be rewarded with lines like this:

```
im: Version 2.05 (for Linux 2.4.0)
im: Found device at ID 6, Attempting to use EPP 16 bit
imm: Communication established at 0x378 with ID 6 using PS/2
scl3 : Iomega VP12 (imm) interface
  Vendor: IOMEGA    Model: ZIP 250           Rev: K.47
  Type: Direct-Access                      ANSI SCSI revision: 02
  Attached scsi removable disk sda at scsi3, channel 0, id 6, lun 0
  SCSI device sdb: 196608 512-byte hdwr sectors (101 MB)
sda: Write Protect is off
sda: sdb4
```

This means that the Linux kernel has found the Iomega external drive on the parallel port. In this example, the drive is called "sda", which means it is the first SCSI drive.

8. Type the following command and press Enter:

```
rebuildfstab -r -u knoppix -g knoppix
```

9. Finally type this and press Enter:

```
in5
```

10. KDE will start up. You will see an icon for the Iomega Zip drive on the Desktop. Assuming you have no other SCSI drives, it will be labelled "Hard disk partition [sda4]".

11. Click the Zip drive icon.

12. Wait for a moment while the Zip drive is mounted.

13. Wait while the "Konqueror" file manager starts up.

14. The files on the Zip drive will be displayed.

15. Right-click on the Zip drive's icon.

16. Click "Change read/write mode".

17. Click "Yes".

18. Drag and drop the files and folders you wish to copy into the Zip drive's window.

19. Click "Copy Here".

20. The dropped items will be copied.

21. When you have finished copying, close the Zip drive's windows.

22. Right-click the Zip drive icon.

23. Click "Unmount".

24. The green triangle on the Zip drive icon will go away.

25. It is now safe to take the Zip disk out of the drive.

---

**Using an Imation LS-120 SuperDisk**

The Imation LS-120 SuperDisk drive crosses laser technology with the floppy disk. "LS" stands for "Laser Servo". Imation SuperDisk media has a capacity of 120 Mb. The Imation LS-120 SuperDisk was quite popular in the 1990s. For example, many computers made by Gateway came
with a SuperDisk drive fitted as standard. Today, the SuperDisk drive is no longer made, but the 120 Mb media is still available.

The SuperDisk drive is an IDE device. It does not use the conventional floppy drive interface. However, the SuperDisk drive is backwards compatible with 1.44 Mb floppy disk media.

Knoppix uses its built-in "AT Attachment Packet Interface" driver to support the SuperDisk drive. Knoppix uses SCSI emulation to treat the SuperDisk drive as a SCSI device. However, because of the way the drive works, it is not automatically detected so a little "helping hand" is needed. To copy files onto an Imation LS-120 SuperDisk drive:

1. Insert an LS-120 disk or conventional floppy disk into the SuperDisk drive.
2. Start Knoppix in the usual way.
4. Point to "Create New".
5. Click "Hard Disk".
6. A window for the new device will appear.
7. On the "General" tab, replace the words "Hard Disk" with a suitable name. For example, enter "LS-120".
8. Click the "Device" tab.
9. In the "Device" drop-down box, choose "/dev/sda", assuming there are no other SCSI devices in the system. Knoppix treats the SuperDisk drive as a SCSI device.
10. Click "OK".
12. Click the icon for the SuperDisk drive.
13. Wait while the device is mounted.
14. Wait while the "Konqueror" file manager starts up.
15. The files on the LS-120 disk or conventional floppy disk will be displayed.
16. Right-click on the icon of the LS-120 drive.
17. Click "Change read-write mode".
18. Click "Yes".
19. Drag and drop the files and folders you want to copy into the SuperDrive's window.
20. Click "Copy Here".
21. The items will be copied.
22. Close the SuperDisk’s windows.
23. Right-click on the SuperDisk’s icon.
24. Click "Unmount".
25. The green triangle on the drive’s icon will go away.
26. It is now safe to take the disk out of the drive.
Quick help

Question: Why does it say "Do not format" on the LS-120 disk?

Answer: All LS-120 disks are factory formatted. Simply deleting all the files on the disk will put it back to factory fresh condition.
Using a network server

Knoppix can copy files to the following types of network file servers:

- File Transfer Protocol (FTP) servers.
- Windows Server Message Block (SMB) servers.
- UNIX Network File System (NFS) servers.

For this to work, you must have a supported network card in your computer. When you start Knoppix, it will automatically pick up an IP address from a Dynamic Host Configuration Protocol (DHCP) server.

Copying to an FTP server

To copy files onto a File Transfer Protocol (FTP) server:

1. Click the "Konqueror" icon in the Panel.
2. The "Konqueror" file and Internet browser will come up.
3. To log in to the FTP server anonymously, type the following on the address line. Replace "server" with the IP address of the server you want to connect to.
   ftp://server
   Example:
   ftp://192.168.1.1
4. If you need a username and password to log in to the FTP server, type the following on the address line. Replace "username" and "password" with your username and password. Replace "server" with the address of the FTP server you want to connect to.
   ftp://username:password@server
   Example:
   ftp://phil:mypass@192.168.1.1
   This will connect to the FTP server at 192.168.1.1 with the username "phil" and password "mypass".
5. The files on the FTP server will appear.
6. Drag and drop the files you want to copy to that window.
7. Click "Copy Here".
8. The files will be uploaded, as long as you have permission to write files to the server.

Copying to a Windows file server

To copy files onto a Microsoft Windows file server:
1. Click the "Konqueror" icon in the Panel.
2. The "Konqueror" file and Internet browser will load.
3. Type the following on the address line. Replace "server" with the hostname or IP address of the Windows file server.
   
```
   smb://server/
```

4. For example:
   
```
   smb://192.168.1.1/
```

5. The public shares on the server with the IP address 192.168.1.1 will be displayed. The workgroup name is detected automatically. If a username and password is required, replace "username" and "password" below with your username and password. Replace "server" with the IP address of the server you want to connect to.
   
```
   smb://username:password@server/
```

Example:

```
   smb://phil:mypass@192.168.1.1/
```

6. This will connect to the Windows file server at the IP address 192.168.1.1 with the username "phil" and password "mypass".

7. Drag and drop the files you want to copy from the Windows hard disk window to the Konqueror window.

8. Click "Copy Here".

9. The files will be copied, provided you have access permission to the Windows file server.

## Copying to an NFS server

To copy files onto a Network File System (NFS) server:

1. Click the Knoppix menu in the bottom left corner.
2. Click "Root Shell".
3. Type the following command, and press Enter at the end of the line.
   
```
   /etc/init.d/portmap start
```

4. The port mapping service will be started. The portmapper is needed to access NFS servers.

5. Enter the following command, again pressing Enter at the end of the line. Replace "server" with the IP address or hostname of your NFS server. Replace "export" with the name of the shared folder on the NFS server.
   
```
   mount server:/export /home/knoppix/tmp
```

Example:

```
   mount 192.168.1.1/home /home/knoppix/tmp
```

6. The NFS export will be mounted to the folder "/home/knoppix/tmp".

7. Click the "Home" icon in the Panel.
8. The files in the Knoppix home directory will be displayed.
9. Click the "tmp" folder.
10. The contents of the shared folder on the NFS server will be displayed.
11. Drag and drop the files you wish to copy into the /home/knoppix/tmp window.
12. Click "Copy Here".
13. Given that you have appropriate file permissions on the NFS server, the files will be copied.
Knoppix has built-in support for hundreds of popular printers. Parallel and USB connections are supported. The best supported inkjet printers are HP and Epson. Many Canon and a few Lexmark printers are also supported. On the laser front, all greyscale Postscript and most greyscale PCL laser printers work.

However, some printers do not work at all with Knoppix. The printers that do not work tend to be cheap Lexmark inkjet printers, and very low cost colour laser printers. Colour laser printers work if they are fully Postscript or PCL compatible. Unfortunately, very low cost colour laser printers tend not to be compatible with either. They are therefore completely incompatible with Knoppix.

To set up a printer connected by a USB or parallel cable:

1. Click the Knoppix icon in the Panel.
2. Point to "Configure".
3. Click "Configure printer(s)".
4. Wait for a moment while the KDE “Printing Manager” starts.
5. Click "Add".
6. Click "Add Printer/Class...".
7. The welcome screen of the "Add Printer" wizard will appear.
8. Click Next.
9. Select "Local printer", then click Next.
10. Select the port that your printer is on. If your printer is connected to the computer's parallel port, select Parallel Port #1 (/dev/lp0). If you have a USB printer, select USB Printer #1 (/dev/usb/lp0). To the computer, the first parallel port is called "/dev/lp0". The first USB printer is called "/dev/usb/lp0". Click Next.
11. Select the manufacturer and model of your printer. If you cannot find your exact printer model in the list, try the nearest available. For example the HP PSC 1200 driver works with the HP PSC 1350, even though the HP PSC 1350 is not in the list. Click Next.

12. This screen appears if Knoppix knows of more than one driver that can operate your printer. Click Next.
13. Click the "Test" button to print a test page on your printer. After a short pause, your printer should start working.

14. When the test page has finished, click Next four times until you get to the "General Information" screen. Enter a short name for your printer, then click Next.

15. Click Finish.
16. The Printing Manager will be displayed again. You may now print from all the applications included in Knoppix. When you exit Knoppix, the printer setup will be lost. However, there is a way to save your setup. See the later section, "Finding permanence".

The test page paper size is US Letter by default. If you are using A4 paper, the test page won't print all the way to the bottom of the page. This is normal.

The Linux printing home page:
http://www.linuxprinting.org/
Connecting to the Internet

Knoppix is a child of the Internet. Knoppix does networking with its eyes closed. The main ways to get connected to the Internet are:

- Through an Ethernet gateway, router or local area network.
- Through an external serial modem.
- Through a PCMCIA serial cardbus modem.

Knoppix is designed first and foremost for wired Ethernet networking. This gives you the best chance of success. Meanwhile, the following connection methods are not so easy with Knoppix:

- Most internal PCI dial-up modems.
- Most external USB broadband modems.
- Most wireless (802.11) PCI and PCMCIA cards.
- Some PCMCIA modem/network combination cards.
- AOL and Compuserve.

The above methods tend to rely on proprietary software that only works on Windows. Even if the proprietary software were available for Linux (which it sometimes is these days) it cannot be distributed with Knoppix due to licence constraints.

Broadband

A broadband Internet connection lets you download at up to ten times the speed of a conventional modem. It also lets you use a telephone handset on the same line at the same time. The technical name for broadband in the UK is “Asynchronous Digital Subscriber Line”, or ADSL. To use broadband Internet with Knoppix, you need:

- A supported Ethernet adapter in your PC or laptop. Knoppix supports 3Com, Intel, NE2000-compatible, Realtek-based and many other cards. Many newer PCs and laptops come with a built-in Ethernet socket.

- An ADSL gateway router/modem. These popular, inexpensive devices combine an ADSL modem with a router, giving “instant Internet”. The single-port variety is for one computer. Multi-port versions let several computers share the same broadband line at the same time.

- A telephone line which has been “activated” for ADSL.

- An account with a ADSL-enabled Internet Service Provider. This means any standard Internet Service Provider that offers a broadband service (not AOL / Compuserve).

- A microfilter for each telephone socket on the ADSL line.
To make the connection:

1. Make sure the Ethernet cable from the router/modem/gateway is connected to the computer's Ethernet adapter.

2. Start Knoppix.

3. During the startup process, Knoppix will automatically detect the network card. Knoppix will obtain an IP address automatically from the ADSL router/modem/gateway.

4. If you have not already done so, use a web browser to visit the ADSL router/modem/gateway's configuration page. To learn about the web browsers included in Knoppix, see the later section, "Browsing the World Wide Web". Enter the necessary information on the configuration page to make the connection to your broadband Internet Service Provider (ISP).

5. You're done! As long as the 'upstream' connection to the Internet is working, you will be connected to the Internet.

**Dial-up**

Dial-up Internet is the older, slower way to access the Internet. To connect this way, you need an account with any standard Internet Service Provider (not AOL / Compuserve) and one of the following:

- An external serial modem. This type of modem connects to the computer's serial port (called COM1 or COM2 under DOS). No special driver is needed to operate this type of modem. Compatibility with Knoppix is guaranteed. For example, the "Sitecom External V92 Serial Modem" works perfectly.
A PCMCIA Cardbus modem. A PCMCIA Cardbus modem is effectively an external serial modem. In general, the cheaper the card, the better. For example, the "Sitecom 56Kbps Fax Modem PC Card" works perfectly with Knoppix.

An internal ISA modem. Like the external modem, this type of modem needs no special driver to make it work. That is why old ISA modems are useful.

There are two main ways to make a dial-up connection. The recommended way is to use “K Point to Point Protocol” (KPPP). The alternative, in case KPPP doesn’t work, is the “Worldvisions Dialer” (WVDial).

Connecting using KPPP

1. Click the Knoppix menu in the lower left corner.
2. Point to Network/Internet.
3. Click "Modem Dialer"

4. The "KDE Point-To-Point Protocol (KPPP)" program will start.

5. Click "Setup".
6. Click the "Device" tab.
7. If your modem is plugged into the serial port called "COM1" in Windows, set "Modem device” to "/dev/ttyS0”. If it is plugged into the port called "COM2" in Windows, select "/dev/ttyS1”. If you have a PCMCIA Cardbus modem, select "/dev/modem". If you have an internal ISA modem, select "/dev/ttyS0" first; if that doesn’t work, try "/dev/ttyS1", "/dev/ttyS2" or "/dev/ttyS3".
8. Click the "Modem" tab.
9. Click "Query modem".

10. You should see a response from the modem. If not, go back to step 7 and try another "modem device" setting.

11. Click the "Accounts" tab.

12. Click "New".
13. Click "Dialog setup".

14. In "Connection name" enter a name for the connection eg "test".

15. Beside "Phone number", click "Add".

16. Enter your Internet Service Provider's dial-up access number. If you don’t know, ask your Internet Service Provider. Click OK.

17. Click OK. This will take you back to the accounts screen.
18. Click OK again.

19. Enter your login ID and password. Again, if you don’t know what they are, ask your Internet Service Provider.

20. Click Connect.

21. You should hear the modem work.

22. In a few moments, the KPPP window should shrink down to the Taskbar. It should then read "00:00" on the Taskbar. This indicates your time online in hours and minutes. Congratulations, you are connected to the Internet.

23. To disconnect, click the KPPP button in the Taskbar.

24. The KPPP window will come back up.

25. Click Disconnect.

26. The phone call will be ended.
**Quick help**

**Question:** It says “The PPP daemon died unexpectedly!”

Answer: Check your username and password.

**Question:** KPPP just doesn't work.

Answer: Sorry, it seems that KPPP doesn’t work with all ISPs. Luckily, there is an alternative. The “Worldvisions Dialer” is included with Knoppix. For an example of how to use “wvdial”, see:

http://support.real-time.com/linux/dialup/wvdial.html
Browsing the Web

Once you have an Internet connection, Knoppix has several different "browsers" built in. A "browser" is a program for connecting to the World Wide Web, which is one of the Internet's most popular services.

- For a quick start, click "Konqueror Web Browser" on the Panel.
- For a more sophisticated web browser, click the "Mozilla Browser" button on the Panel. Mozilla Web Browser takes longer to start than Konqueror, especially on slower computers with limited RAM.
- For a minimal web browser, click K menu -> Internet -> Dillo.
- For text-only web browsing (yes, really), click K menu -> Internet -> Lynx. Then hit the letter G (for Go). You will be prompted to enter the web address that you want to visit. Type the web address that you want, then press Enter. The web page will be loaded.
Email

Knoppix has several different "email clients". An email client is a program that lets you send and receive Internet email. Here is how to set up the "KMail" email client in Knoppix:

1. Click the K menu in the bottom left corner.
2. Point to "Internet".
3. Click "KMail (Mail Client)".
4. The KMail mail program will be loaded.
5. Click the "Settings" menu.
6. Click "Configure KMail".

7. The KMail configuration screen will appear. On the left side, ensure that "Identities" is selected. Click "Modify".

8. Enter your real name, organisation and email address, then click OK.

9. Click "Network".
10. Click "Remove".
13. In the "Host" box, enter the hostname of your Internet Service Provider's outgoing SMTP (Simple Mail Transfer Protocol) server. If the SMTP server requires authentication, check the "Server requires authentication" box and enter your username and password for sending mail.

14. Click OK.
15. Click the "Receiving" tab.
16. Click "Add".
17. Select the type of incoming mail server you have. Most Internet Service Providers use POP (Post Office Protocol). Some provide IMAP (Internet Message Application Protocol).
18. Click OK.
19. Enter your login and password for receiving your email. Enter the host which provides your incoming email in the "Host" box.

20. Click OK. This takes you back to the "Configure KMail" screen.
21. Click OK again.

22. To see if you have new mail, click the "File" menu, then "Check Mail". Or click the "Check Mail In" button on the toolbar. KMail will look for your new messages.

23. To write email, click the "Message" menu, then "New Message". Or click the "New Message" button on the Toolbar.

24. When you have finished writing, click the "Message" menu, then "Send". Or click the "Send" button in the Toolbar.

**Important**

Knoppix will not let you accidentally run Linux programs received by email. All programs must be given "execute permission" before they can be run by double-clicking on them. This gives you excellent protection against would-be "email viruses", while still letting you open ordinary document attachments easily.
Scanning

Knoppix has built-in support for some scanners. Scanning in Knoppix is simple, if you are lucky enough to have a fully compatible scanner. Scanner support is provided by a program called "Scanner Access Is Now Easy". If your scanner is fully supported, you don't have to do any setup at all. To test if your scanner works in Knoppix:

1. Click K menu.
2. Click Multimedia.
3. Click XScanImage.
4. If the scanner is detected, the device name will be shown at the top of the window. For example, if you have an Epson Perfection 1260 USB, it will say "Plustek:/dev/usbscanner" at the top of the window.
5. Assuming your scanner is detected, click "Preview Window".
6. Click Acquire Preview.
7. The image that the scanner sees will be shown.
8. Lasoo the area to be scanned using the mouse.
9. Click "Scan".
10. The marked area will be scanned to an image file.

Web link
The Scanner Access Is Now Easy home page:
http://www.sane-project.org/
Sound

Knoppix has built-in support for many sound cards. Well supported cards include Soundblaster compatibles, Creative Soundblaster Live, C-Media 8738, Intel i810, Ensoniq, Crystal Soundfusion and the Via 82c series of sound cards.

Testing sound in KDE

1. Click K Menu.
2. Point to Settings.
3. Click Control Center.
4. Wait for a moment while the "KDE Control Center" starts.
5. On the left side, click Sound & Multimedia.
7. On the right side, click “Start aRTs server on KDE startup”
8. Click Apply.
9. Click Test Sound.
10. You should hear the KDE startup sound.

**Testing sound in XMMS**

To play the built-in demonstration music file:

1. Click the CD-ROM icon for your Knoppix CD.
2. Click the "Demos" folder.
3. Click the "Audio" folder.
4. Click the "opensource.ogg" file.
5. Wait while the "X Multimedia System" application starts.
6. The demonstration song will play.

If the demonstration song does not start automatically, click the "Play" button (bottom row, second from the left, in the XMMS window) to begin.
Volume controls

To adjust the sound volume levels:

1. Click K Menu -> Multimedia -> Sound -> KMix (Sound Mixer).
2. The main volume control is on the far left. Move the slider up for louder and down for quieter.

To learn what each slider does, hover the mouse pointer over the icon at the top. A little yellow label will appear, such as “Microphone”.

Muting

The green spots are called the “mute buttons”. The mute button turns on and off output from the corresponding channel. Light green means on, dark means off (muted). All the channels are on by default.

Note

The microphone channel has no output, since it’s only used for recording (input). KMix gives the microphone channel a mute button anyway. The mute button on the microphone channel has no effect.

Closing KMix

When you close KMix, it goes into the System Tray which is in the bottom right corner of the screen. To get KMix back again, right-click its icon in the System Tray, then click “Show Mixer Window”.

84
Quick help

Question: I can't get KMix to start by clicking in the K menu.
Answer: KMix is already started. Right-click its icon in the System Tray (bottom right corner of the screen), then click “Show Mixer Window”.

Sound recording

This explains how to test sound recording through your sound card. For this to work, you need a microphone plugged in to the “Mic” socket on the sound card.

1. Bring up the KMix window. If KMix is already running, right-click its icon in the System Tray, then click “Show Mixer Window”. If KMix is not already running, click K Menu -> Multimedia -> Sound -> KMix (Sound Mixer).

2. Click the red button at the bottom of the Microphone channel. This sets KMix to record from the Microphone channel. You can only record from one channel at a time.

4. Wait for a moment while the “Audacity” application starts up.

5. To start recording, click the large red circle (record) button.
6. The waveform of the sound from the microphone will appear while it is recorded.

7. To stop recording, click the yellow square (stop) button.

8. To hear the result, click the green triangle (play) button.

Audacity is a multi-track sound recorder. Each new recording that you make is stored in a new track. This lets you overlay sounds on top of each other. To get rid of a recorded track, click the small X on the left side next to the words “Audio Track”.
Playing audio CDs

Knoppix has a built-in player for “Compact Disc Digital Audio” music CDs. Unlike data CDs, audio CDs don’t need to be mounted in order to be played. The ideal is to have two CD drives in your computer – one for the Knoppix CD, and one for the audio CD that you want to play.

1. Click K Menu.
2. Point to Multimedia.
3. Point to Sound.
4. Click KsCD (CD Player).
5. The CD player application will appear.
6. Put the audio CD in the drive that is not occupied by Knoppix.
7. Click the big “Play” button in the KsCD window to begin.

8. The audio CD will be played.

If your CD-ROM drive is wired to the sound card, you will hear the music through the speakers attached to the sound card. If you can’t hear anything, plug your speakers or headphones into the audio out socket on the front of the CD drive. Then adjust the volume level using the volume control on the front of the CD drive.

When you close KsCD, it will “dock” into the System Tray in the bottom right corner of the screen. To get it back again, click its icon in the System Tray.

Note

Some audio CDs are designed not to work on a computer CD-ROM drive. They should be clearly marked. They may also not work on some non-computer CD players such as in-car players.

If you are not satisfied with your audio CD, return it to the shop and ask for a refund. It is simply cheaper and easier for the seller to give you your money back than argue.
Playing DVD movies

Knoppix has a built-in player for DVD movies. This section will help you test a DVD-ROM drive for DVD movie playing.

What is DVD?

DVD stands for “Digital Versatile Disc”. It was originally called “Digital Video Disc”. A DVD disc can contain data, audio or video. DVD Read Only Memory (ROM) drives are backwards compatible with CD-ROM drives, so they can read old Compact Disc media.

DVD movies in Knoppix

Unfortunately, Knoppix cannot play most commercial DVD movie discs. It can only play DVD movie discs that are unencrypted. Even more unfortunately, there is no label to tell you which discs are encrypted and which are not. The DVDs that are most likely to work are:

- Home-made, demonstration or movie trailer discs.
- Discs without a DVD Region label. Technically, these are called “Any Region” discs. A region code attempts to stop a disc sold in one country working in another country. A disc with a region code is marked with a world globe containing a number between 1 and 8.

The suggested media for testing purposes is a demo or movie trailer disc without a region code. For example, some European Dell PCs came with a “Movie Trailers” DVD that is both unencrypted and all-region.

Playing

It is best to have two CD drives: one drive for Knoppix, and one DVD capable drive for the movie disc. To play an unencrypted DVD movie:

1. Click K Menu.
2. Point to Multimedia.
3. Point to Video.
4. Click Xine Media Player.
5. Wait for a moment while “Xine” starts up.
6. The Xine player application will appear.
7. Put the disc in the DVD drive that is not occupied by Knoppix.
8. Click the “DVD” button in Xine.
9. If the DVD is unencrypted, and the region check is passed, the movie will begin playing.

10. If it says “Error reading NAV packet”, most likely this means the DVD is encrypted and so it cannot be played. Try another disc.
Changing the region

Some discs have a DVD Region code but are not encrypted. These are rare. Xine uses “Region 1” (US / Canada / US Territories) by default.

**DVD Region Codes**

1: U.S., Canada, U.S. Territories
2: Japan, Europe, South Africa, and Middle East (including Egypt)
3: Southeast Asia and East Asia (including Hong Kong)
4: Australia, New Zealand, Pacific Islands, Central America, Mexico, South America, and the Caribbean
5: Eastern Europe (Former Soviet Union), Indian subcontinent, Africa, North Korea, and Mongolia
6: China
7: Reserved
8: Special international venues (airplanes, cruise ships, etc.)

To change the region:

1. Click the Xine Setup button. When you hover the mouse pointer over the “Setup” button, a blue spanner icon will appear in the Xine display, and a “Setup window” tooltip will appear.

2. Click the “Input” tab.

3. Under “Region that DVD player claims to be”, choose the region number that you want. For example, choose “2” for United Kingdom (Europe).

4. Click Apply, then Close.
5. The region will be changed. This change affects only the Xine software. It will not alter your DVD drive. It will not affect any other DVD movie playing software that you may have.

**Why don't encrypted DVDs work?**

Encrypted DVDs do not work with Knoppix because the application “Xine Media Player” has not been authorised by the “DVD Copy Control Association”. Getting authorisation is expensive and highly restrictive. An authorised DVD playing application cannot be distributed with Knoppix, because of licence constraints. Therefore, Knoppix only has limited support for DVD movies, for legal reasons.

**Content Scrambling System**

DVD encryption works using “Content Scrambling System” (CSS). It is described as “copy control”, but it actually only affects playback.

**DeCSS**

Of course, for every wall there is a higher ladder. An (in)famous person called “DVD Jon” discovered how to make a fully functional yet unauthorised DVD movie player. The result is called “DeCSS”. DeCSS allows commercial DVD playing in Xine. However, DeCSS cannot be distributed with Knoppix, for legal reasons.

DVD Frequently Asked Questions (and Answers)
http://dvddemystified.com/dvdfaq.html

A partial list of commercial but Xine friendly DVD movie discs:
http://www.videolan.org/removed/freedvd.html

Quick help

**Question:** It says “Error reading NAV packet”.

Answer: The movie is probably encrypted. Knoppix cannot play it.

**Question:** How do I know if a DVD is encrypted or not?

Answer: You don’t. There is no official label. The presence (or not) of a region code is a guide but not definitive. The only way to find out is to try it with Xine and see if it works.
Other applications

Knoppix includes many other useful and fun applications. There isn’t space to describe them all fully here. In this section are some of the highlights to look out for.

Graphics

The Gimp

The GNU Image Manipulation Program (The Gimp) is a wonderful graphics editor. It is for painting, image editing and photo retouching. Many people think The Gimp is the greatest thing after Linux itself. To start using it, click K menu -> Multimedia -> Graphics -> The Gimp.

The screenshot below shows Wilber, the Gimp’s mascot. Wilber was created by Tuomas Kuosmanen, also known as "Tiger T". Underneath is the Gimp Toolbox, and a Brushes dialog.
Office applications

OpenOffice.org office suite
OpenOffice.org is the slowest but most powerful office application in Knoppix. OpenOffice.org combines word processing, spreadsheets, presentations and drawing in one huge package. On slower computers, OpenOffice.org may take several minutes to start. To begin using OpenOffice.org, click K menu -> Office -> OpenOffice.org -> OpenOffice.

KOffice
KOffice is a simple office suite, for word-processing, spreadsheet, drawing, presentations and other tasks. Unlike OpenOffice, KOffice is quick to start. To begin, click K menu -> Office -> KOffice, then click the program you would like to use.

Gnumeric
Gnumeric is a powerful standalone spreadsheet application. Like KOffice, Gnumeric is quick to start. To begin, click K menu -> Office -> Gnumeric.

AbiWord
AbiWord is a simple word standalone processor. To get started, click K menu -> Office -> AbiWord word processor.
Toys and amusements

KStars planetarium

KStars shows the position of the stars and planets in the sky in real time. KStars can show the view of the sky from hundreds of locations around the world. It also has a catalogue of planets, stars and other objects. To start using KStars, click K menu -> Entertainment -> Science -> KStars.
Frozen Bubble

Frozen Bubble is an arcade style bubble bursting game for one or two players. The idea is to hit two or more other bubbles of the same colour to make them disappear. To start, click K menu -> Games -> Tetris-like -> Frozen-Bubble.
KSokoban

KSokoban is a gemstone-pushing puzzle game. The object of the game is to move the red diamonds onto the green squares, only by pushing the red diamonds. Move the man using the cursor keys. To begin, click K menu -> Games -> Tactics & Strategy -> KSokoban.
GTans

GTans is a shape-building puzzle game. Move, rotate and flip the shapes to make the larger shape shown on the right hand side. To start, click K menu -> Games -> Puzzles -> GTans.
Finding permanence

"The box said that I needed to have Windows 98 or better... so I installed Linux." -- LinuxNewbie.org

Overview

Knoppix lets you store personalised settings, document files and system settings on a disk. This saves you from having to set up Knoppix from scratch every time you run it.

Creating a persistent Home directory

Personalisation is what makes your computer yours. Personalised settings include application preferences, for example, your favourite KDE background wallpaper. Documents are files that you create using Knoppix applications, such as graphics and word processed document files. Personalised settings and documents are stored in a special place called your "Home directory".

Knoppix lets you keep your Home directory on another disk. This makes it possible to use a personalised Knoppix account everywhere you go. For example, you can sit down at one computer, do some work, go to another computer, and carry on working.

This works best with a USB hard drive stick, also known as a USB flash drive. These marvellous little gadgets give you hundreds of megabytes of storage, in a space no bigger than a key fob. A USB flash drive is the ideal companion to a Knoppix CD. To create a persistent Home directory on a USB flash drive:

1. Insert your USB flash drive.
2. Wait for a moment while the drive is detected.
4. Note the name of the new icon. For example, if there are no other SCSI drives in the computer, it will be labelled "Hard disk partition [sda1]".
5. Right-click on the USB flash drive icon.
6. Click "Mount".
7. Right-click on the USB flash drive icon again.
8. Click "Change read/write mode".
9. It will ask if you want to make the partition writable. Click "Yes".
10. Click the Knoppix menu in the Panel.
12. Point to "Configure".
13. Click "Create persistent KNOPPIX home directory".
14. Click "Yes".
15. Choose the partition that corresponds to your flash drive. In this example, "/dev/sda1" represents the flash drive.
16. You will be asked if you want to encrypt the file that will be created on the flash drive. This is optional, so click "No".
17. Enter how big in megabytes you would like your Knoppix home directory to be. For example, enter “100” for 100 megabytes. Imagine you have a 256 Mb flash drive. This will create a 100 megabyte file on the flash drive, leaving 156 Mb free for other files.

18. Click OK.

19. Wait while Knoppix prepares the flash drive. If the flash drive has an activity light, you will see it working for a few moments.

20. You will be asked if you want to use the entire partition. Click “No”. This will leave existing files on the flash drive alone.

21. Wait while Knoppix completes the setup process.

22. Knoppix will tell you what you need to type at the boot prompt to use the persistent Knoppix home directory on your flash drive. Make a note of what it says, then click OK.

You must reboot for the change to take effect. Shut down Knoppix and restart. At the boot prompt, type the following command, replacing 'sda1' as appropriate:
During startup you should see a message like this:

Mounting /mnt/sda1/knoppix.img as /home/knoppix...
/home/knoppix mounted OK.

This means it worked. The USB flash drive will now be used for the home directory of the “knoppix” user.

**Important**

With a persistent home directory on a flash drive, the flash drive will be in use all the time. Do not take the flash drive out until you have shut down Knoppix.

### Saving system settings

Saving system settings is called making a "Knoppix configuration archive". This stores settings that are saved in the system-wide configuration directory, not in the home directory. For example, it allows you to save your printer setup, so you don’t have to do it again next time. To save the system settings:

1. Click the Knoppix menu on the Panel.
2. Point to “Configure”.
3. Click “Save KNOPPIX configuration”
Personal configuration. If you have a persistent Knoppix home directory, you do not need this. If you do not have a persistent Knoppix home directory, this option covers the personalised settings you have made in programs like the KDE Control Center, and your personalised settings in applications such as AbiWord. It does not include document files, such as saved word processor files. It also does not include cache files from web browsing.

All files on the Desktop. If you have a persistent Knoppix home directory, you do not need this. If you do not have a persistent Knoppix home directory, select this option to save the new disk icons or program icons that you may have created on the Desktop.

Network settings. If you have a persistent Knoppix home directory, and all you are doing is using the KPPP dialer to connect to the Internet via a modem, you do not need this. KPPP configuration is saved as part of your Knoppix home directory.

The network settings saved by this option include Local Area Network (LAN), manually configured dial-up networking (modem), Integrated Services Digital Network (ISDN) and Asynchronous Digital Subscriber Line (ADSL) settings. For example, if you have set up your network card manually, select this option to save the configuration for next time.

Graphics subsystem settings. This saves settings for the "X Window System" (the graphics display). For example, if you specified a certain screen resolution when you started Knoppix, this option will save that setting.

Other system configuration. This option saves the printer setup and all other system-wide settings.

5. Click OK.

6. Select the device that you would like to save onto. For example, assuming you have a USB flash drive, and there are no other SCSI drives in the system, choose /mnt/sda1.

7. Click OK.
8. Wait while the archive is created.

9. If it worked, it will say, "Creation of the KNOPPIX configuration archive was successful". It will tell you the command to use at the boot prompt to load the saved settings.

10. Click OK to exit.

To load the saved settings next time you start Knoppix, use the "myconfig" parameter at the boot prompt. For example, assuming you saved the archive to /mnt/sda1, at the boot prompt enter:

knoppix myconfig=/mnt/sda1

If it works you will see something like this near the end of the startup messages (Ctrl+Alt+F1):

Checking /mnt/sda1 for KNOPPIX configuration file...
Found, now executing /mnt/sda1/knoppix.sh
Advanced startup options

“There is only one satisfying way to boot a computer.”
-- J. H. Goldfuss

Overview

This section explains the bootup options for Knoppix. Use these options to fine-tune Knoppix for your hardware and speed it up.

Enabling DMA

The first and foremost way to make Knoppix run faster that almost everyone can use is to enable DMA. It stands for Direct Memory Access. It improves the speed of hard disk drives and it can also help CD-ROM drives. DMA is not supported on all computers, so Knoppix turns it off by default. To enable DMA, add 'dma' to your boot command, for example:

`knoppix lang=uk dma`

To test the speed of the hard disk drive, click the Knoppix menu, choose "Root Shell" and enter:

`hdparm -t /dev/hda`

Replace "hda" with the device name of your hard drive appropriately. After a pause of about 3 seconds, you will get a little report that will tell you how fast your hard drive reads data. DMA makes a pretty big difference. For example, look at these sample test results:

<table>
<thead>
<tr>
<th>Drive</th>
<th>Without DMA</th>
<th>With DMA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seagate Barracuda 7200 RPM IDE</td>
<td>8.5 MB/sec</td>
<td>26.8 Mb/sec</td>
</tr>
</tbody>
</table>

If you only have a single CD drive

Knoppix takes over your CD drive and you can’t eject it during your session. What if you want to use the CD drive for something else? For example, you may want to create CDs using a CD-ReWritable drive. If you only have one CD drive, this will be a problem.

Luckily, there is a solution. It is possible to run Knoppix from a hard drive or RAM, freeing up the CD drive for other tasks.

Transferring to a hard disk partition

Transferring to a hard disk partition means copying the CD contents onto a hard disk. This is called “copying the CD image”. Once this is done, Knoppix starts in the normal way but from the hard drive instead the CD-ROM drive.
This gives improved performance, because hard disk drives are generally much faster than CD-ROM drives. It also frees up your CD-ROM drive for other tasks. It does not affect the existing files on the hard drive. All it does is use up hard drive space, which can be reclaimed later.

To transfer to a hard disk partition, you need:

- An MS-DOS, FAT or Linux formatted hard disk partition. NTFS (native Windows NT/2000/XP) partitions cannot be used.
- At least 700 Mb free space on the partition.

At the boot prompt, enter this command. Replace "device" with the device name of the hard disk partition that you want to use.

```
knoppix tohd=device
```

For example, suppose you have Windows 98. You probably have Windows installed on the first partition of the primary master IDE drive. In this case, use:

```
knoppix tohd=/dev/hda1
```

Knoppix will start from CD, copy itself to the specified device and then continue loading from there. You can then take the Knoppix CD out of the drive.

**Re-using an existing image**

You only need to copy the CD image to the hard disk once. Next time, you can read back from the hard disk, without having to copy the CD image again.

At the boot prompt, enter this command. Replace "device" with the device name of the hard disk partition where the Knoppix CD image is located.

```
knoppix fromhd=device
```

For example:

```
knoppix fromhd=/dev/hda1
```

Knoppix will start from CD, pick up the CD image from the specified device and continue loading. You can then take the Knoppix CD out of the drive.

**Deleting the image**

In Windows, remove the "KNOPPIX" directory from the hard drive using Windows Explorer. This will give back the hard drive space occupied by the CD image.

**Transferring to RAM**

If you have 828 Mb or more of RAM, you can copy the Knoppix CD image to RAM. After an initial wait, transferring to RAM gives dramatically improved performance, and the Knoppix CD is not needed. You need 828 Mb of RAM because the first 700 Mb is used for the CD image. The remaining 128 Mb is used for the system and applications.

At the boot prompt, enter this command:
Knoppix will start from CD, transfer the CD image to RAM, and continue loading. Once transfer to RAM has completed, you can take the Knoppix CD out of the drive.

More hardware options

These options let you fine-tune Knoppix for your particular hardware. They can be combined in any order. For example, to start Knoppix with the US language/keyboard, a wheel mouse, a screen resolution of 800x600 and Direct Memory Access (DMA) enabled for hard drives, type this at the boot prompt:

```
knoppix lang=uk wheelmouse screen=800x600 dma
```

Knoppix assumes you have a laptop. It starts up with PCMCIA (credit card adapter) interface support enabled by default. If you have a desktop computer, rather than a laptop, you can improve performance slightly by typing the "nopcmcia" option at the boot prompt. For example, to start the computer with the US locale, a wheel mouse, a screen resolution of 1024x768, and no PCMCIA:

```
knoppix lang=us wheelmouse screen=1024x768 nopcmcia
```

If you have less than 128 Mb RAM

After loading the kernel and the base system, Knoppix looks to see how much RAM is left. The kernel and the base system takes about 20 Mb of RAM. The remainder is called free RAM, or available RAM.

If there is less than 80,000 Kb free RAM, Knoppix will automatically prompt you to create a "swap file". A swap file lets you use part of the hard disk as if it were RAM.

This trick lets you run Knoppix in full, even when you have less than 128 Mb RAM. For example, it is possible to run Knoppix successfully on a computer with only 64 Mb of RAM. However, you pay a performance penalty, because swap is much slower than physical RAM.

To create a swap file, you need a hard disk with at least one partition that is formatted with the FAT filesystem. NTFS formatted partitions cannot be used.

1. Start Knoppix in the usual way.

2. You will get a message that says, "There are only X Kb of RAM available in your computer".
3. Press Enter.

4. Knoppix will automatically search for an available FAT formatted partition. If there is more than one, Knoppix will choose the last available partition. You will be asked if you want to create a swap file on the partition that Knoppix has selected.

5. Using the arrow keys on the keyboard, make sure "Yes" is highlighted, then press Enter.

6. You will be asked how big a swap file you want to create. You need a swap file that is large enough to take the free RAM + swap file total to at least 80,000 Kb.

7. Type the size of the swap file you wish to create. In this example, it says there is 49,152 Kb of physical RAM free. The suggested swap file size of 60 Mb will bring the free total to 108 Mb.

8. Press Enter.
9. Wait for a moment while Knoppix creates the swap file.

10. Press Enter to continue loading Knoppix.

**Tip**

Next time you start Knoppix, it will detect and use the swap file automatically. To remove the swap file and reclaim the disk space it occupies, exit Knoppix, start Windows, then delete the file called “knoppix.swp” using Windows Explorer.
Alternatives to KDE

Knoppix has six alternative “desktops”. Using an alternative to KDE lets you run the X Window System on a computer that doesn’t have enough RAM for KDE. It also saves loading time, because the alternatives load much more quickly than KDE. The alternatives are:

Ice Window Manager

A small and fast window manager in the Microsoft Windows style.
Window Maker

A simple and elegant window manager with a very solid feel.
Fluxbox

Similar in style to Window Maker.
Xfce

Xfce stands for "The Cholesterol Free Desktop Environment".
Lars Window Manager

An alternative window manager. In Lars Window Manager, almost everything is done with the keyboard instead of the mouse. Lars Window Manager is designed for programmers that spend most of their time working with text.
Tab Window Manager

TWM is designed to use as little RAM as possible. If you start Knoppix on a computer without enough RAM to run KDE, it will run Tab Window Manager instead.
Starting an alternative window manager

Use one of these commands at the boot prompt.

knoppix desktop=icewm          # IceWM
knoppix desktop=wmaker          # Window Maker
knoppix desktop=fluxbox         # Fluxbox
knoppix desktop=xfce            # Xfce
knoppix desktop=larswm          # Lars Window Manager
knoppix desktop=twm             # Tab Window Manager

For example, to start with Window Maker, in the UK locale, with DMA, and without PCMCIA:

knoppix desktop=wmaker lang=uk dma nopcmcia

Mounting and unmounting disks and partitions using KDiskFree

You may have noticed there are no desktop disk icons, when using an alternative to KDE. Luckily, you can still use KDE’s disk management tools even when you are outside KDE. For example:

1. Start Knoppix into Window Maker.
2. Click the "XTerm" icon (right hand side, second from the top).
3. Enter this command:
   
   kdf

4. Wait while "KDiskFree" starts.
5. Right-click on the icon of the disk or partition to be used.
6. Click "Mount".
7. Right-click on the icon again.
8. Click "Open in file manager".

9. The files on the disk or partition will be displayed.
**Important:** Disks and partitions are mounted **read-write** by KDiskFree.

# Text mode

Text mode is the fastest way to start Knoppix. Text mode is meant for those who are familiar with the UNIX command line interface. There are plenty of excellent books on the subject, such as "Sams Teach Yourself UNIX in 24 Hours".

## Starting

To start Knoppix in text mode, enter this at the boot prompt.

```
knoppix 2
```

## Leaving

Enter this command to exit Knoppix:

```
halt
```

## Localisation

Text mode is called "runlevel 2". When started in text mode, Knoppix uses the 'C' locale. The 'C' locale is defined as the "default" locale for applications, meaning that their strings are displayed as written in the initial code, without passing through a translation lookup. Just plain old ASCII. Literally, the 'C' locale turns off localisation.

To enable localisation, specify the locale that you want to use with the "lang=" option. For example, enter this at the boot prompt to load Knoppix in text mode with the UK regional settings:

```
knoppix 2 lang=uk
```

## Adjusting the keyboard layout

To switch to a UK keyboard layout, type this and press Enter at the end of the line.

```
loadkeys uk
```

The keyboard map will be changed to UK layout.

## Accessing disks and partitions in text mode

Use the "mount" command. For example, to mount the first partition on the primary master IDE hard drive:

```
cd /mnt
mount hda1
```

The files on the device "/dev/hda1" will be mounted to "/mnt/hda1". To view the files on the partition:

```
cd hda1
ls
```
The files will be displayed. To learn more about navigating and copying files in text mode, see "Sams Teach Yourself UNIX in 24 Hours".

**Important**

Disks and partitions are mounted **read-write** by the `mount` command.

### Getting a hardware listing in text mode

Use these commands to get hardware information in text mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Shows</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lspci</code></td>
<td>PCI devices</td>
</tr>
<tr>
<td><code>cat /proc/bus/usb/devices</code></td>
<td>USB devices</td>
</tr>
<tr>
<td><code>cat /proc/cpuinfo</code></td>
<td>Processor information</td>
</tr>
<tr>
<td><code>cat /proc/meminfo</code></td>
<td>Random Access Memory details</td>
</tr>
<tr>
<td><code>cat /proc/scsi/scsi</code></td>
<td>SCSI device information</td>
</tr>
<tr>
<td><code>dmesg</code></td>
<td>Kernel messages</td>
</tr>
</tbody>
</table>

**Tip**

Press Shift + Page Up to see lines that have scrolled off the top of the screen.
Recovering from freezes

It is possible for the X Window System, the K Desktop Environment, or an individual application to “freeze up”. This section explains what to do if that happens.

Getting rid of an individual application

The most common situation is to have a program that just doesn't seem to want to go away. Even when you click the close button on its window, it still won’t disappear. To get rid of it:

1. Press Ctrl+Alt+Esc on the keyboard.
2. The pointer will change into a skull and crossbones.
3. Point anywhere inside the window that you want to get rid of.
4. Click the left mouse button.
5. The errant program will be killed.

Restarting the X Window System

If more than one program seems to be stuck, you may need to restart the X Window System. To do that:

1. Press Ctrl+Alt+F2.
2. Type this command, then press Enter:
   
   init 2

3. You will see the message “X Window System shut down”. This will also end the K Desktop Environment and all its open applications.
4. Enter this command:
   
   init 5

5. The X Window System will be restarted. The KDE desktop will appear again as it did when you first started Knoppix.
Getting help

"Where's the 'Any' key?" -- Homer Simpson

How to get help

On the CD
The Knoppix CD carries the official list of frequently asked questions and answers. It is provided in several languages. To read the English version:

1. Click the CD-ROM icon for your Knoppix CD
2. Click the "KNOPPIX" folder.
3. Click the "KNOPPIX-FAQ-EN.txt" file.
4. Wait for a moment while the "KWrite" application starts.
5. The English version of the "Frequently Asked Questions" file will appear.

From the Web
See the official Knoppix web site for further FAQs, user forums, and how to get the latest version of Knoppix.

Web link
The official Knoppix web site:
http://www.knoppix.net/

By email
There is a mailing list, which is for development of Knoppix. The discussions are in German and English.

The mailing list homepage is:

http://mailman.linuxtag.org/mailman/listinfo/debian-knoppix

The archives are at:

http://mailman.linuxtag.org/pipermail/debian-knoppix/

With Internet Relay Chat
If you are looking for somewhat instant answers, Internet Relay Chat (IRC) is the place to be. To talk to other Knoppix users using IRC:

1. Make sure you are connected to the Internet.
2. Click K Menu.
3. Point to Internet.
4. Click X Chat.
5. Wait for a moment while the "X Chat" application starts.
6. In the Nick Names boxes, enter up to three nicknames which you would like to be known as. You must enter at least two nicknames, in case your preferred nickname happens to be in use when you join the chat server.
7. In the Username box, enter the username or login which you use to connect to your Internet Service Provider.
8. In the Real Name box, type your real name.
9. Under "Networks", scroll down to "Freenode".
10. Click "FreeNode".
11. Click "Connect".
12. The message of the day from the IRC server will be shown.

13. Type the following command and press Enter:

   /join #knoppix

14. You will be “joined” to the “#knoppix” IRC channel. The messages in the channel will appear on the left. The nicknames of the people who are in the channel will be shown on the right.

15. Ask your question, remembering to spell and punctuate correctly. The other IRC users will do their best to help you. Enjoy the chat!
Tip

Before using IRC, check to see if your question is already answered in the "Frequently Asked Questions". Knoppix users would love to see more people using IRC. However, if you ask a question that is already answered in the Frequently Asked Questions, you may be told to look there - or maybe something ruder!

Making X Chat fonts larger

If you find the writing too small in X Chat:

1. Click the "Settings" menu at the top of the X Chat window.
2. Click "Preferences".
3. Next to "Font", click "Browse".
4. Choose the font size you would like to use.
5. Click OK.
6. Click OK.
7. The fonts will change to the size you chose.
Appendixes

Full list of Knoppix boot options

- `knoppix lang=cn|de|da|es|fr|it|nl` specify language/keyboard
- `knoppix lang=pl|ru|sk|tr|tw|us` specify language/keyboard
- `knoppix alsa` use ALSA sound driver (at your own risk)
- `knoppix desktop=fluxbox|icewm` use specified WM instead of KDE (1)
- `knoppix desktop=kde|larswm|twm` use specified WM instead of KDE (2)
- `knoppix desktop=wmaker|xfce` use specified WM instead of KDE (3)
- `knoppix screen=1280x1024` use specified Screen resolution for X
- `knoppix xvrefresh=60` use 60 Hz vertical refresh rate for X
- `knoppix xhrefresh=80` use 80 kHz horizontal refresh rate for X
- `knoppix xserver=XFree86|XF86_SVGA` use specified X-Server
- `knoppix xmodule=ati|fbdev|i810|mga` use specified XFree4-Module (1)
- `knoppix xmodule=nv|radeon|savage|s3` use specified XFree4-Module (2)
- `knoppix xmodule=radeon|svga|i810` use specified XFree4-Module (3)
- `knoppix 2` runlevel 2, Textmode only
- `knoppix floppyconfig` run "knoppix.sh" from a floppy
- `knoppix myconf=/dev/sda1` run "knoppix.sh" from a partition
- `knoppix myconf=scan` try to find "knoppix.sh" automatically
- `knoppix home=/dev/sda1/knoppix.img` mount loopback file as /home/knoppix
- `knoppix home=scan` automatic search for knoppix homedir
- `knoppix no{apic,agp,apm,audio,ddc}` skip parts of HW-detection (1)
- `knoppix no{firewire,pcmcia,scsi}` skip parts of HW-detection (2)
- `knoppix no{swap,usb}` skip parts of HW-detection (3)
- `failsafe` boot with (almost) no HW-detection
- `knoppix pci=irqmask=0x0e98` try this, if PS/2 mouse doesn't work *)
- `knoppix pci=bios` workaround for bad PCI controllers
- `knoppix ide2=0x180 nopcmcia` boot from PCMCIA-CD-ROM (some notebooks)
- `knoppix mem=128M` specify Memory size in MByte
- `knoppix dma` enable DMA for ALL IDE-Drives
- `knoppix noeject` do NOT eject CD after halt
- `knoppix noprompt` do NOT prompt to remove the CD
- `knoppix vga=normal` no-framebuffer mode, but X
- `knoppix blind` start Braille-Terminal (no X)
- `knoppix brltty=type,port,table` parameters for Braille device
- `knoppix wheelmouse` enable IMPS/2 protocol for wheelmice
- `knoppix nowheelmouse` force plain PS/2 protocol for PS/2-mouse
- `knoppix keyboard=us xkeyboard=us` use different keyboard (text/X)
- `knoppix splash` boot with fancy background splashscreen
- `knoppix toram` copy CD to RAM and run from there
- `knoppix fromhd=/dev/hda1` copy CD to HD partition and run there
- `knoppix testcd` boot from previously copied CD-Image
- `knoppix tohd=/dev/hda1` check CD data integrity and md5sums
- `expert` Interactive setup for experts

GNU General Public Licence

Version 2, June 1991
Copyright (C) 1989, 1991 Free Software Foundation, Inc.
59 Temple Place, Suite 330, Boston, MA  02111-1307  USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your
freedom to share and change it.  By contrast, the GNU General Public
License is intended to guarantee your freedom to share and change free
software--to make sure the software is free for all its users.  This
General Public License applies to most of the Free Software
Foundation's software and to any other program whose authors commit to
using it.  (Some other Free Software Foundation software is covered by
the GNU Library General Public License instead.)  You can apply it to
to your programs, too.

When we speak of free software, we are referring to freedom, not
price.  Our General Public Licenses are designed to make sure that you
have the freedom to distribute copies of free software (and charge for
this service if you wish), that you receive source code or can get it
if you want it, that you can change the software or use pieces of it
in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid
anyone to deny you these rights or to ask you to surrender the rights.
These restrictions translate to certain responsibilities for you if you
distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether
gratis or for a fee, you must give the recipients all the rights that
you have.  You must make sure that they, too, receive or can get the
source code.  And you must show them these terms so they know their
rights.

We protect your rights with two steps: (1) copyright the software, and
(2) offer you this license which gives you legal permission to copy,
distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain
that everyone understands that there is no warranty for this free
software.  If the software is modified by someone else and passed on, we
want the recipients to know that what they have is not the original,
so that any problems introduced by others will not reflect on the original
authors' reputations.

Finally, any free program is threatened constantly by software
patents.  We wish to avoid the danger that redistributors of a free
program will individually obtain patent licenses, in effect making the
program proprietary.  To prevent this, we have made it clear that any
patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and
modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains
a notice placed by the copyright holder saying it may be distributed
under the terms of this General Public License.  The "Program", below,
refers to any such program or work, and a "work based on the Program"
means either the Program or any derivative work under copyright law:
that is to say, a work containing the Program or a portion of it,
either verbatim or with modifications and/or translated into another
language.  (Hereinafter, translation is included without limitation in
the term "modification".)  Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not
covered by this License; they are outside its scope.  The act of
running the Program is not restricted, and the output from the Program
is covered only if its contents constitute a work based on the
Program (independent of having been made by running the Program).
Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's
source code as you receive it, in any medium, provided that you
conspicuously and appropriately publish on each copy an appropriate
copyright notice and disclaimer of warranty; keep intact all the
notices that refer to this License and to the absence of any warranty;
and give any other recipients of the Program a copy of this License
along with the Program.

You may charge a fee for the physical act of transferring a copy, and
you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion
of it, thus forming a work based on the Program, and copy and
distribute such modifications or work under the terms of Section 1

125
above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any other attempt to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the
Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute the Program so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS
GNU Free Documentation Licence

GNU Free Documentation License
Version 1.2, November 2002

Copyright (C) 2000,2001,2002 Free Software Foundation, Inc.
59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

0. PREAMBLE

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is printed as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or to automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats...
include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties; any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

3. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.

C. State on the Title page the name of the publisher of the Modified Version, as the publisher.

D. Preserve all the copyright notices of the Document.

E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

H. Include an unaltered copy of this License.

I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.

N. Do not retile any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.

O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add them to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one. The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

5. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, the title of each such section uniquely identifying the section may be added at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must include any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

6. COLLECTIONS OF DOCUMENTS
You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this license in the various documents with a single copy that is included in the collection, provided that you follow the rules of this license for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this license in the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Free Software Foundation does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.
